= *Syn.* *Allure*, *Lure*, *Entice*, *Decoy*, *Seduce*, attract, invite, coax, engage, prevail on. The first five words imply the exercise of strong but subtle influences over the mind or senses. *Allure*, *lure*, to attract by a lure or bait, to draw by appealing to the hope of gain or the love of pleasure, either big or little, the former, however, seems to imply a more definite object than *lure*, which retains perhaps a little more of the original meaning, though it is less often used. *Entice* expresses most of skill, subtlety, flattery, or fair speech. *Decoy* is to lead into a snare by false appearances, this word is the one most commonly used in a physical sense. *Seduce*, to lead astray, generally from rectitude, but sometimes from interest or truth.

The almoner is now best represented in monasteries and in the church, where he is required to distribute alms to the poor. Almoners were formerly attached to the household of a sovereign, and were afterwards attached to the household of a sovereign's household, and were in the position of various kinds. In France the name early became synonymous with *chaplain*, (see *chaplain*.) The *round almoner* of the realm was

regularly a cardinal or other high prelate, since the Revolution this post has been alternately restored and abolished. In England there is a *lord almoner*, or *lord high almoner*, an ecclesiastical officer, formerly a bishop, who formerly had the custody of all deadlands and the goods of all suicides, which he had to distribute to the poor. He now distributes twice a year the sovereign's bounty, which consists in giving a silver penny each to as many poor persons as the sovereign is years of age. There is also a *sub-almoner*, and a hereditary *round almoner*. The office of the latter is now almost a sinecure.

ridian, and the time of rising of a star over the wires is noted; the telescope is then pointed to west of the meridian, and the time of descending of a star is noted. In this way, if the positions of the stars are known, the correction of a timepiece and the latitude may be determined, on the other hand, if these are known, either the right ascensions or the declinations of the stars may be determined. The instrument is of great value on account of its having fewer instrumental errors than a meridian circle.

(AS.) use the reference is usually to the *agallochum*, but it is often difficult to tell which meaning is intended, and even in modern writers the difference is often ignored.] The common name of the plants of the genus *Aloe*. They are natives of warm climates of the old world, and are especially abundant in the southern part of Africa. Among the Mohammedans the aloe is a symbolic plant, especially in Egypt, and every one who returns from a pilgrimage to Mecca hangs it over his street-door, as a token that he has performed the journey. In Africa the leaves of some species of aloe are made into ropes, fishing-lines, bow-strings, and hammocks. Several species yield aloes, the well-known bitter purgative medicine. The *American aloe* is the century-plant, *Aloe Americanum*, and the *false aloe* is *A. Virginica*. See *Aloe*. Many species are cultivated for ornament, growing readily on very dry soil. See *aloes*.

aloes (al'ōz), *n.* sing. or pl. (pl. of *aloe*, used also as sing.). [See *aloe*.] 1. A drug, the inspissated juice of several species of aloe. It is obtained from the leaves, sometimes by cutting them across, when the resinous juice exudes and is evaporated into a firm consistency, sometimes by pressing the juice and mangle out together, and in other cases by dissolving the juice out of the cut leaves by boiling and then evaporating to a proper consistency. Several kinds are known in commerce. Socotrine aloes, also called East Indian or Zanzibar aloes, the produce mainly of varieties of *A. Perotii*, comes chiefly from Red Sea ports and Aden. Barbados and China aloes are produced in the West Indies from *A. vulgaris*, which has been introduced from the Mediterranean. Cape and Natal aloes are obtained probably from *A. ferox*, and form by far the greater part of the supply. The name *hepatic aloes* is applied to any opaque and liver-colored variety of the drug. The extract of aloes when treated with nitric acid gives rise to various yellow and brown products, which by the aid of mordants can be fixed to silk and wool; but they are seldom used in dyeing.

2. The fragrant resin or wood of the *agallochum*; lign-aloes; aloes-wood; wood-aloes: the usual meaning in the Bible. See *agallochum*.—**Fetid, caballine, or horse aloes**, a coarse, impure preparation of aloes. *C. S. Dispensatory*.

The term *Alsacia* has in recent times been applied extensively to the English Stock Exchange, because of the supposed questionable character of some of its proceedings.

The earliest altars were turf mounds, large flat topped stones, or other rude elevations, natural or artificial; but when temples came to be built altars were generally made of hewn stone, marble, or metal, and became more and more ornate. Greek and Roman altars were round, triangular, or square in plan, often elaborately adorned with sculpture, and bearing inscriptions. Sometimes, as at Pergamon, the altar was a structure of vast size and complex plan, and was in itself an art monument of the highest importance. In the Jewish worship two altars were used: the altar of burnt-offering, which stood at the entrance to the tabernacle, and afterward occupied a corresponding position in the temple, and the altar of incense, which stood in the holy place. Both were made of shittim-wood, the former being overlaid with brass, the latter with gold.

3. The steps at the sides of a grave-dock. **Family altar**, the practice or the place of family worship or devotions. **High altar**, the chief or principal altar in a cathedral or other church having more than one altar. It stands beyond the choir at the end of the sanctuary or chancel opposite the front or the main entrance, and usually has behind it a screen, reredos, or dossal, so as to make it, even when there is an ambulatory with chapels or any other feature behind it, the chief object on which the eye rests on entering the church. Lesser or side altars often stand in chapels or against the pillars of the nave. See *cut* under *cathedral*. **Privileged altar**, in the Rom. Cath. Ch., an altar to which are attached certain indul-

Butler*, Coptic Churches, II, i, 3-5.

altar-bread (âl'târ-bred), *n.* Bread prepared for the eucharist. Unleavened bread is required for this purpose in the Roman Catholic Church, and is used in many Anglican churches, in which either leavened or unleavened bread is permitted. In both the latter is made into small thin disks or wafers, called severally *altar-breads*, usually stamped with some emblem, as the cross or crucifix, or I. H. S. In the former church, after consecration, the altar-bread is called *host* (see *host*), and the wafers are of two sizes, the larger for the priest, the smaller for the people. The Greek Church uses leavened bread especially made for the purpose. See *oblate*, *n.*, 1.

This was called *sepulchrum* in the Latin Church, *thalassa* or *thalassidion* in the Greek Church, and seems to have existed universally as late as the fifteenth century. It is a general term, and includes the close case of linen which was used in the middle ages and removed only for washing the altar, the later cerecloth (which see), and the temporary coverings, whether of white linen, or of rich stuff, or of embroidery. The different coverings for the altar have different names. See *antependium*, *frontal*, and *superfrontal*.

On the continent of Europe they are found in the societies of many churches, and are frequently used, carried on either side of the church, at funerals and solemn processions of the blessed sacrament, in those divisions of the church which practise reservation of the holy eucharist. *Lee*, *Eccles. Terms*.

altar-ledge (âl'târ-lej), *n.* A step or ledge behind the altar of a church and raised slightly above it, to receive ceremonial lights, flowers, or other ornaments or symbols. Sometimes there are two or more steps or ledges. In modern usage often called *retable*, though the retable is more properly higher, and in itself an important architectural or decorative feature. See *retable*. Also termed, but incorrectly, *super-altar*.

altar-light (âl'târ-lit), *n.* A light placed upon or near an altar, and having a symbolical meaning. In the Roman Catholic Church the lights are often set upon the altar itself, in the church of England they always stand on an altar-ledge behind or beside the altar.

In churches of the Renaissance period it is more usually a painting of a sacred subject, but in those of the early middle ages it is frequently of embossed silver or of rich gold and enameled work set with jewels, as the famous Pala d'Oro of St. Mark's in Venice.

As the altar stood free in the choir, and the *altarpiece* was to be seen from behind as well as from before, both sides were to be covered with painting.

altar-rail (âl'târ-râl), *n.* A low rail or barrier running transversely to the main axis of the church and separating the sanctuary from those portions of the church that are in front of it. Also called *communion rail*, as communicants kneel at this rail to receive the eucharist.

altar-table (âl'târ-tâ-bl), *n.* 1. In a Christian church, the top or the consecrated portion of an altar; the altar proper, or mensa.—2. A name for one of the wooden tables which were substituted for the old altars in England in the seventeenth century, and used for the communion where the old altars had been destroyed by the Roundheads. At first this table was placed by the reformers against the eastern wall in the position of the old stone altar. This position gave umbrage to the Puritans, who held that it was characteristic of the Church of Rome. Cromwell therefore caused the altar-table to be removed to the middle of the chancel, and to be surrounded with seats for the communicants. At the restoration it was almost universally replaced in its ancient position. When used it is covered with a white linen cloth.

Alternate generation. (a) In *zool.*, a term first used by Steenstrup to signify the production of animals which are unlike their parents, but of which certain later generations alternately recurring exhibit a likeness to those parents; or, a mode of reproduction in which more than one generation, counted from a given progenitor, must pass before the appearance of a descendant resembling that progenitor. It is defined by Owen as consisting in a series of individuals which seem to represent two species alternately reproduced. Huxley defines it as an alternation of asexual with sexual generation, in which the products of one process differ from those of the other. According to Allman, the intercalation of a proper sexual reproduction is necessary to constitute true alternate generation. (b) In *cryptogamic bot.*, the passage of a plant through a succession of unlike generations before the initial form is reproduced. Usually the succession is one in which one sexually produced form alternates with another produced asexually. The alternation of these sexually produced may be with those pathogenetically produced (*heterogametes* or *heterogametes*, which see), or with those produced by budding (*autogametes*).

F. *alun* = MHG. *alūn*, G. *alun* (> Pol. *alun* (barred l), Sloven. *alun* = Russ. *gālmūt* = Lith. *alūnas*), < L. *alumen*, alum; of unknown origin.] The general name of a class of double sulphates formed by the union of aluminium, iron, chromium, or manganese sulphate with the sulphate of some other metal, commonly an alkaline metal or ammonium. Common or potash alum has the formula $\text{Al}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$. It is produced by mixing concentrated solutions of potassium sulphate and crude aluminium sulphate. The double salt at once crystallizes in octahedrons. Alum is soluble in water, has a sweetish-sour taste, reddens litmus, and is a powerful astringent. In medicine it is used internally as an astringent, externally as a styptic applied to severed blood-vessels. In the arts it is used as a mordant in dyeing, and extensively in other ways. When mixed in small amount with inferior grades of flour, it is said to whiten them in the process of bread-making, but its effect on the system is injurious. Alum shale, another name for *alum slate*, including especially its more siliceous varieties. Alum slate, a variety of clay slate containing more or less carbonaceous material (remains of seaweeds, etc.), with which is associated an easily decomposed and frequently occurring compound of sulphur and iron (marcasite). The decomposition of this substance gives rise to an efflorescence of alum, usually potash alum, which is a compound of potassium sulphate and aluminium sulphate. Burnt alum, alum from which the water of crystallization has been driven off by heat. Also called *dried alum*, *alumen exsiccatum*. Concentrated alum, normal aluminium sulphate, $\text{Al}_2(\text{SO}_4)_3$, which is prepared on a large scale by treating roasted clay with oil of vitriol and crystallizing out the sulphate formed. It is largely used in dyeing. Also called *patent alum*.—**Earth alum**, or basic alum, the mineral alum-stone.—**Earth of alum**. See *earth*.—**Roman alum**, a variety of potash alum prepared from the mineral alum-stone, of special value to dyers, since it contains no soluble iron salts. alumina (a-lū'mi-nā), *n.* [NL., < L. *alumen* (*alamin*-); see *alum*.] The oxid of aluminium, Al_2O_3 , the most abundant of the earths. It is widely diffused over the globe in the shape of clay, loam, and other similar substances; corundum, in its varieties adamantine-spar, the ruby, and sapphire, is alumina nearly pure and crystallized. In these forms alumina is, next to the diamond, the hardest substance known. Its great value in the arts depends on its affinity for vegetable coloring matters and animal fiber. It forms the base of the lakes in dyeing, and acts also as a mordant. United with silica it is extensively used in the manufacture of all kinds of pottery and porcelain-ware, crucibles, mortar, and cements.

aluminate (a-lū'mi-nāt), *v. t.*; pret. and pp. *aluminated*, ppr. *aluminating*. [*< L. aluminatus*, pp. adj., < *alumen* (*alumin*-); see *alum*.] To treat or impregnate with alum; specifically, in printing engravings, to wash (the paper) with alum-water to prevent the running of the lines.

aluminium (al-ū-min'i-um), *n.* [NL. (> F. *alumine*, > E. *alum*), < L. *alumen* (*-min*-), alum (see *alum*), + *-ium*, as in *sodium*, *potassium*, etc.; first proposed by Sir H. Davy, the discoverer of the metal, in the form *aluminum* and then *aluminium*.] Chemical symbol Al; atomic weight 27.1. A metal of silver-white color and brilliant luster, about as hard as zinc, very malleable and ductile, highly sonorous, and a good conductor of heat and electricity. Its most remarkable character is its low specific gravity (2.56), which is about one third that of iron and less than that of marble. It does not tarnish in the air, and even in a molten state does not oxidize; its melting-point is somewhat lower than that of silver. Aluminium in combination with oxygen (Al_2O_3) forms the common earth alumina, which exists in nature as the mineral corundum, of which the ruby, sapphire, and emery are varieties; the hydrated sesquioxide exists as the minerals diaspore, gibbsite, and bauxite. Alumina also enters into the composition of a very large number of minerals, the most important of which are the feldspars. From the decomposition of these, clay (kaolin, etc.) is produced, which is essentially a hydrated silicate of aluminium. Among other important minerals containing aluminium are the silicates andalusite, cyanite, diopside, topaz, and all of the zeolites; the fluoride of aluminium and sodium, cryolite, from which the metal is reduced; the oxide of aluminium and magnesium, spinel; the phosphates aluminite, alum-stone, the alums, etc.; the phosphates turquoise, lazulite, etc.; the carbonate dawsonite, and many others. It is estimated that in its various compounds aluminium forms about one twelfth of the crust of the earth. In consequence of its very low specific gravity, freedom from tarnish, non-poisonous qualities, and ease of working aluminium is a most valuable metal, and would be extensively used if it were not for the cost of separating it from the combinations in which it occurs in nature. It is used, however, to a limited extent by itself and in alloys for physical apparatus and other articles in which lightness and great strength are necessary. The cap of the Washington monument, which forms the tip of its lightning rod, is a pyramidal mass of aluminium weighing 1600 pounds. Also written *aluminum*.—**Aluminium bronze**, an alloy of 9 parts of copper with 1 of aluminium. It resembles gold in luster and color, and is used as a cheap imitation of that metal. Unlike gold, however, it gradually tarnishes on exposure to the air. It is much used in cheap jewelry and ornamental work, and also for a great variety of industrial purposes, especially for bearings in machinery. — **Aluminium silver**, a

compound formed by the addition of a small amount of silver to aluminium. It is said that 3 per cent. of silver is sufficient to give to aluminium the color and brilliancy of pure silver, over which it has the great advantage of not being tarnished by sulphureted hydrogen. **Aluminium solder**, an alloy of gold, silver, copper, and, for soft solder, a little zinc; used in soldering aluminium bronze.

A diplomatic agent of the highest rank, employed to represent officially one prince or state at the court or to the government of another. Diplomatic agents are divided into three general classes: (1) *ambassadors*, *legates*, and *nuncios*; (2) *envoys* and *ministers plenipotentiary* (including *ministers resident*); (3) *chargés d'affaires*. Ambassadors represent the person of their sovereigns, as well as the state from which they come, and are entitled to ask an audience at any time with the chief of the state to which they are accredited; to rank next to the blood royal; to exemption from local jurisdiction for themselves and their households; to exemption from imposts and duties, immunity of person, free exercise of religious worship, etc. The United States sent and received no ambassadors till 1893, but only ministers of the second rank, who were often popularly called ambassadors. The nuncios of the pope who are not cardinals, and the *legati a latere* and *de latere*, cardinals in rank, represent the papal see in its ecclesiastical capacity mainly, and bear the rank of ambassadors. Envoys, ministers, and ministers plenipotentiary are held to represent, not the person of the sovereign, but the state from which they are sent, and they are accredited to the sovereign of the state to which they are sent. This is the ordinary class of diplomatic representatives between less important states, or between greater and smaller states. Ministers resident accredited to the sovereign enjoy a rank similar to that of envoys. *Chargés d'affaires* are resident agents of their governments, and are provided with credentials to the minister of foreign affairs, with which officer at the present day, however, both ambassadors and ministers have to deal almost exclusively in their official relations. See *minister*.

Hence — 2. In general, any diplomatic agent of high rank; an agent or a representative of another on any mission. — 3. A thing sent as expressive of the sentiments of the sender.

But as the AS. and other forms are glossed by the various Latin names *amphora*, *lagena*, *urceus*, *cadus*, *batus*, *situla*, *hydria*, etc., the sense 'one-handled' does not seem to be original, and the spelling may have been corrupted to suit the popular etymology, the real source being then L. *amphora*, a two-handled vessel: see *amphora*. The OHG. *ein-bar*, so developed as 'one-handled,' would naturally be followed by *zui-bar*, 'two-handled.']) 1. A vessel with one handle; a pail; a bucket; a pitcher. — 2. 2. A mineralized pale-yellow, sometimes reddish or brownish, resin of extinct pine-trees, occurring in beds of lignite and in alluvial soils, but found in greatest abundance on the shores of the Baltic, between Königsberg and Memel, where it is thrown up by the sea. It is a hard, translucent, brittle substance, having a specific gravity of 1.07. It is without taste or smell, except when heated, it then emits a fragrant odor. Its most remarkable quality is its capability of becoming negatively electric by friction; indeed, the word *electricity* is derived from the Greek for amber, *ἤλεκτρον*. It sometimes contains remains of extinct species of insects. It yields by distillation an empyreumatic oil consisting of a mixture of hydrocarbons and succinic acid. It is now used chiefly for the mouth-pieces of pipes and for beads, and in the arts for amber varnish. In mineralogy it is called *succinea*. Artificial amber is for the most part copalony.

It is the muscle formerly known as the *quadratus* muscle of birds; but its identity with the mammalian *quadratus* is questionable. Most birds, as the entire order *Passeres*, have no ambiens. The presence or absence of the muscle has lately been made a basis of the division of birds into two primary series in Gaillard's classification, birds having it being termed *Homalioptera*, those lacking it *Avimimoptera*. See these words.

The *ambiens* arises from the pelvis about the acetabulum, and passes along the inner side of the thigh; its tendon runs over the convexity of the knee to the outer side, and ends by connecting with the flexor digitorum perforatus. . . . When this arrangement obtains, the result is that when a bird goes to roost, and squats on its perch, the toes automatically clasp the perch by the strain upon the *ambiens* that ensues as soon as the leg is bent upon the thigh, and the tarsus upon the leg, the weight of the bird thus holding it fast upon its perch.

ambry (am'bri), *n.*; pl. *ambries* (-briz). [In actual modern speech only in north. Ambries are still used in Roman Catholic churches as depositories for the consecrated oils. They are sometimes made portable, in the form of a chest or cupboard, which is hung near the altar.

(c) A place for keeping books; a library.—2. Same as *almory*. [Erroneous use: see *etym.*]

ambs-acet, *n.* See *ambes-ace*.

ambulacra, *n.* Plural of *ambulacrum*.

ambulacral (am-bū-lā'krāl), *a.* [*ambulacrum* + *-al*.] Of or pertaining to an ambulacrum, or to the ambulacra, of an echinoderm.—**Ambulacral face**, **ambulacral aspect**, that surface of an echinoderm which bears the ambulacra; corresponding in a starfish to the oral aspect, that upon which the creature creeps.—**Ambulacral groove**, a furrow which marks the course of an ambulacrum.

[In a starfish] a deep furrow, the *ambulacral groove*, occupies the middle of the oral surface of each ray, and is nearly filled by contractile sucker-like pedicels, . . . apparently arranged in four longitudinal series.

Huxley, *Anat. Invert.*, p. 475.

Ambulacral metameræ, the divisions of the body of an echinoderm as marked or determined by the ambulacral system, as the five fingers or rays of a starfish. See extract under *ambulacral vessels* and cut under *Astrophyton*.—**Ambulacral nerve**, a nerve which is in relation with the ambulacra.

When the suckers of an ambulacrum [of a starfish] are . . . cut away, a longitudinal ridge is seen to lie at the bottom of the groove between their bases. This ridge is the *ambulacral nerve*. Followed to the apex of the ray, it ends upon the eye and its tentacle; in the opposite direction, it reaches the oral disk.

Huxley, *Anat. Invert.*, p. 478.

Ambulacral neural canal, a tube of which the ambulacral nerve forms the outer wall.—**Ambulacral ossicle**, one of a double row of small hard pieces which come together in the ambulacral groove, extending from its sides to its middle line. Also called *vertebral ossicle*. See cut under *Asteriidae*.—**Ambulacral plate**, one of those coronal plates of a sea-urchin which are perforated to form part of an ambulacrum. See cut under *ambulacrum*.

In the ordinary Echinus or sea-urchin . . . of these plates there are twenty principal longitudinal series, constituting the great mass of the corona; and ten single plates, which form a ring around its aboral or apical margin. The twenty series of longitudinal plates are disposed in ten double series—five ambulacral and five interambulacral. . . . Each *ambulacral plate* is subdivided by a greater or less number of sutures . . . into a corresponding number of minor plates, . . . called pore plates.

Huxley, *Anat. Invert.*, p. 486.

Ambulacral sac, in echinoderms, that portion of the vasoperitoneal sac of the embryo which lays the foundation for the whole system of the ambulacral vessels. See *vasoperitoneal* and *Holothuroidea*.—**Ambulacral system**, the water-vascular system (which see, under *water-vascu-*

lar) of echinoderms.—**Ambulacral vesicle**, a sac situated upon the aboral face of an ambulacral ossicle.—**Ambulacral vessels**, the water-vascular channels of the ambulacra. See cut under *Echinodermata*.

Another marked peculiarity of the Echinoderm type is the general, if not universal, presence of a system of *ambulacral vessels*, consisting of a circular canal around the mouth, whence canals usually arise and follow the middle line of each of the ambulacral metameræ.

Huxley, *Anat. Invert.*, p. 54.

Circumoral ambulacral vessel, that into which a radial canal of the ambulacral system of vessels opens at its oral end. **Radial ambulacral vessels**, those which radiate from the central or circular vessel which surrounds the gullet.

Ambulacraria (am-bū-lak-rā'ri-ā), *n.* pl. [NL., < *ambulacrum* + *-aria*.] 1. A branch or subkingdom of animals, constituted by the Echinodermata and Echinozoa, and divided into *Radiata* and *Bilateria*, the latter represented by the genus *Balanoglossus* alone. *Metschnikoff*.—2. [i. e.] The coronal ambulacra of sea-urchins.

Ambulacrata (am-bū-lak-rā'tā), *n.* pl. [NL., neut. pl. of *ambulacratus*, < *ambulacrum*.] A term applied by E. R. Lankester to a branch of echinoderms consisting of the *Holothuroidea*, *Echinoidea*, and *Asteriidea*, or sea-cucumbers, sea-urchins, and starfishes, as collectively distinguished from the crinoids or *Tentaculata* (which see).

ambulacriform (am-bū-lak'ri-fōrm), *a.* [*L. ambulacrum* + *forma*, form.] Possessing the form or appearance of an ambulacrum.

ambulacrum (am-bū-lā'krum), *n.*; pl. *ambulacra* (-krā). [NL. use of L. *ambulacrum*, a walk,

A, three ambulacral plates of *Echinus sphaera*, showing sutures of the pore-plates of which each ambulacral plate is composed. B, a portion of the extent of the petaloid ambulacrum of a clypeastroid.

alley, < *ambulare*: see *ambulate*.] In zool., a row, series, or other set of perforations in the shell of an echinoderm, as a sea-urchin or starfish, through which are protruded and withdrawn the tube-feet or pedicels. Each such row or set of holes usually forms a narrow grooved line from base to apex of a sea-urchin, and from the center to the end of each ray of a starfish, along the oral aspect of the body. Each set or radiating series of perforations is an ambulacrum, the several rows together being the ambulacraria. The usual definition of ambulacra as the perforated spaces through which the tube-feet are protruded leaves a doubt whether an ambulacrum is not one such perforated space. Ambulacra is sometimes used for the tube-feet themselves, collectively; in which case it properly signifies several sets or series of tube-feet, not several tube-feet of any single row or series.

The ambulacraria present important variations in the three divisions of the Echinidea. *Huxley*, *Anat. Invert.*, p. 489.

To repair; mend. [Now rare.]—4t. To heal or recover (the sick); cure (a disease).=Syn. Amend, Improve, Better, Emend, Mend, Correct, Rectify, Reform, Ameliorate.

Amend is generally to bring into a more perfect state by the removal of defects: as, to *amend* a record or one's manner of life. *Improve* and *better* are the only words in the list that do not necessarily imply something previously wrong; they may mean the heightening of excellence: as, to *improve* land or one's penmanship. *Better* is also used in the sense of surpass. *Correct* and *rectify* are, by derivation, to make right; they are the most absolute, as denoting the bringing of a thing from an imperfect state into conformity with some standard or rule: as, to *correct* proof; to *rectify* an error in accounts. To *mend* is to repair or restore that which has become impaired: as, to *mend* a shoe, a bridge, etc. Applied to things other than physical, it may be equivalent to *amend*: as, to *mend* one's manners. *Emend* has especially the limited meaning of restoring or attempting to restore the text of books. *Reform* is to form over again for the better, either by returning the thing to its previous state or by bringing it up to a new one; or it may be to remove by reform: as, to *reform* the laws; to *reform* abuses. *Ameliorate* is not commonly applied to persons and things, but to condition and kindred abstractions; it expresses painstaking effort followed by some measure of success: as, to *ameliorate* the condition of the poor.

See *Indians*.—**American party**, in U. S. hist., a political party which came into prominence in 1848. Its fundamental principle was that the government of the country should be in the hands of native citizens. At first it was organized as a secret, oath-bound fraternity; and from their professions of liberality in regard to it, its members received the name of Know-nothings. Ignoring the slavery question, it gained control of the governments of several Northern and Southern States in 1848 and 1850, and nominated a presidential ticket in 1856; but it disappeared about 1859, its Northern adherents becoming Republicans, while most of its Southern members joined the short-lived Constitutional Union party. An antislavery party of the same name appeared in 1875, but gained very few votes. See *Nature American party*, below.

In 1844 it carried the city elections of New York and Philadelphia, and elected a number of Congressmen. It gained no further successes, and disappeared within a few years, after occasioning destructive riots against Roman Catholics in Philadelphia and other places.

Ametabola (am-e-tab'ō-lā), *n. pl.* [NL., < Gr. *ἀμετάβολος*, unchangeable: see *ametabolous*.] In *zool.*, insects which do not undergo metamorphosis. In Macleay's system of classification, a term borrowed from W. L. Leach to designate a subclass of *Insecta* by which the myriapods, thysanurous, and anoplurous "insects" should be collectively contrasted with the true insects, which undergo metamorphosis. Myriapods being excluded from the class *Insecta*, and lice being located with insects that are not thoroughly ametabolous, *Ametabola* is by some authors restricted to the collembolous and thysanurous insects. The term is correlated with *Hemimetabola* and with *Metabola*.

M'Leay has formed them [Myriapoda] into two orders, Chilopoda and Chilognatha, raising them, together with the two other orders, Thysanura and Anoplura (or Parasita, Latr.), and certain annulated vermes, into a distinct class, to which he applied the name of *Ametabola*, which Leach had proposed only for the spring-tailed insects and lice. J. G. Westwood, in Cuvier's Regne Animal (trans.), [1849], p. 483.

In many insects and in the higher vertebrates, the embryo acquires a special protective envelope, the *amnion*, which is thrown off at birth. *Huxley*, *Anat. Invert.*, p. 67.

3. A reflected portion of a membrane, in ascidians, which lines the inner wall of the ovisac, and forms a kind of amniotic investment of the embryo.

[*cap.*] A genus of microscopic rhizopodous *Protozoa*, of which *A. diffusus*, common in all fresh-water ponds and ditches, is the type. It exists as a mass of protoplasm, and moves about and grasps particles of food, etc., by means of pseudopodia, or finger-like processes, which it forms by protruding portions of its body. From thus continually altering its shape it received its former name of *proteus animalcule*. Within the body are usually found a nucleus and nucleolus, and certain clear spaces, termed *contractile vesicles*, from their exhibiting rhythmic movements of contraction and dilatation. There is no distinct mouth, and food seized by means of the pseudopodia is engulfed within the soft sarcode body and by any portion of its surface, the apertures by which the food is taken in closing up immediately after its reception. Reproduction takes place in several ways, but chiefly by fission, whereby an amœba simply divides into two portions, each of which becomes a distinct animalcule. Several other species have been described; but there is reason to think that some of these, at least, may be early forms of other and more complex animals, or even of plants. The term appears to have been first used by Ehrenberg in 1830, as the name of a genus of his *Polygasteria*.

The position of the quadrate bone is peculiar; the skull in general resembles that of an ophidian; the vertebrae are procoelous, and have neither zygantrum nor zygosphenon; there is no sacrum; and all but one or two of the precaudal vertebrae bear ribs. The bodies of these lizards are completely snake-like. All the representatives of the group are limbless, excepting members of the genus *Chirotes*, which have a pair of small pectoral limbs. The tail is extremely short, so that the vent is near the end of the body. The integument is not scaly.

and several rays, and a dorsal fin crowded out of place by the extension of the dermal armature. It is a most remarkable type, and exceptional among fishes on account of the peculiar development of the skeleton as a sort of shell around the body. ampliative (am'pli-ā-tiv), *a.* [*L. ampliatus* + *-ive*.] Enlarging; increasing; synthetic. Applied (a) In *logic*, to a modal expression causing an amplification (see *ampliation*, 3); thus, the word *may* in "Some man may be Antichrist" is an *ampliative* term. (b) In the *Kantian philosophy*, to a judgment whose predicate is not contained in the definition of the subject: more commonly termed by Kant a *synthetic* judgment. [**Ampliative judgment* in this sense is Archbishop Thomson's translation of Kant's word *Erweitern*, *enlargement*, translated by Prof. Max Müller "expanding judgment."]

No subject, perhaps, in modern speculation has excited an intense interest or more vehement controversy than Kant's famous distinction of analytic and synthetic judgments, or, as I think they might with far less of ambiguity be denominated, explicative and *ampliative* judgments.
Sir W. Hamilton.

an¹, *a* (an, a, oran, ä). [*< ME. an*, before a vowel, occasionally before a consonant; *a*, before a consonant (see *a2*); *< AS. ān*, an, with the reg. adj. declension in sing. and pl. (pl. *an*, some, certain), and the same word as *ān*, one, its use as an indef. art. being comparatively rare. When so used, it was without emphasis, and became in ME. short in quantity (hence E. short *an*, *a*), while the numeral *an*, retaining its emphasis and quantity, developed reg. into E. *one*, pronounced on (as in *only*, *alone*, *at-one*), in mod. times corrupted to wōn and finally to wun: see *one*.] The indefinite article. As between the two forms of this word, the general rule is that *an* be used before an initial vowel-sound of the following word, and *a* before an initial consonant-sound: thus, *an eagle*, *an answer*, also *an hour* (the *h* being silent); and *a fool*, *a youth*, *a wonder*, also *a* *hour*, *a* *endog*, *a* *one* (these three words being pronounced as if they began with *a* or *o*). But *an* is still sometimes used before a consonant-sound, especially before the weak consonant *h*; and in written style, and in more formal spoken style, *an* is by many (especially in England) required before the initial *h* of a wholly unaccented syllable, as if such an *h* were altogether silent: thus, *an hotel*, but *a hostess*; *an historian*, but *a history*; *an hypothesis*, but *a hypothetical*. In colloquial speech, and increasingly in writing, *a* is used in all these cases alike. As by its derivation, so also in meaning, *an* or *a* is a weaker or less distinct *one*. (1) In certain phrases, and with certain nouns, it still has nearly the value of *one*: thus, *a* of a trade; they were both *a* size; *a* hundred, *a* thousand, *a* million. (2) Usually, as the indefinite article proper, it points out, in a loose way, an indeterminate class of one of a class containing more of the same kind: thus, give me *a* pint of milk; *a* is *an* apple; they built *a* house; we see *a* man; the earth has *a* moon, our sun has *a* fixed star. (3) Hence, before a proper noun, it implies extension of the name or character of the individual to a class: thus, he is *a* *Chero* (that is, a person like *Chero*, a country like *England*). (4) It is used, apparently, before a plural noun, if *a* or *many* (thus, *a* *few* apples, *a* *great many* soldiers); but the plural noun is here historically a genitive-partitive dependent on *a* or *many*. (5) It is used distributively, or with the meaning of *each* or *every*, in such phrases as *two dollars a piece*, *three times a day*, *five cents an ounce*; but *a* or *an* is here historically a preposition. See *a2*. (6) *A* or *an* is here historically a preposition to which it belongs, and in general also any other adjective word qualifying the same noun; but *a* *fool* and *such* come before it: thus, *what a shame!* *such a* beauty; and so also any adjective preceded by *how*, *so*, or *as*, or *as*, or *too*: thus, *how great a calamity*, *so rare a case*, *as good a man*, *too early a death*. *Many a* is a phrase of peculiar meaning. See *many*.

an² (an, an), *conj.* [A reduced form of *and*, existing from the earliest ME. period, and often then so written; but in mod. literature *an* for *and* and copulative is admitted only in representations of dialectal or 'vulgar' speech, and is then usually printed *an'*. In conversation, however, though not in formal speech, the *d* is generally dropped, especially before a word beginning with a consonant, and the vowel may be weakened to the point of vanishing. *An'* for *and*, if, is archaic in literature, and is generally printed *an*, in distinction from *and* copulative.] *I.* Coordinate use: *And*; same as *and*, *A*.

(a) After the Cuvierian system of classification, a family characterized by the division of the superior pharyngeals into small irregular lamellae, more or less numerous, and intercepting the gill-containing water, which thus flows upon and moistens the gills while the fish is out of water. It includes the ophiocephalids as well as the anabantids proper, the osphronomids, and the helostomids. (b) Among later authors, a family characterized by a compressed oblong body, moderate dorsal scales, and a subperibranchial organ in activity necessary to the gill-chamber. It includes the osphronomids and the helostomids as well as the typical anabantids. (c) By Cope the family was limited to *Leborethans* with the second epiphyaryngeals suppressed, the first superior branchiys with three laminae, and the second and third developed. The name is best known historically as applied to the followers of Thomas Munzer, a leader of the peasants' war in Germany, who was killed in battle in 1525, and to those of John Matthias and John Beekold, or John of Leyden, who committed great excesses while attempting to establish a socialist kingdom of New Zion at Mount Zion at Munster in Westphalia, and were defeated in 1535, their leaders being killed and hung up in iron cages, which are still preserved in that city. The name has also been applied to bodies of very different character in other respects, probably always in an opprobrious sense, since believers in the sole validity of adult baptism refuse to regard it as rebaptism in the case of persons who had received the rite in infancy. It is now most frequently used of the Mennonites. See *Mennonite*.

It is distinguished by neither index of *Phenacanthoides*, characterized by having the two sides of the head unsymmetrical and containing the flat bones of the family *Phenacothidae*, and *Leptacanthidae*, having the head symmetrical. By later writers it has been restricted to the forms manifesting bilateral symmetry. By Cope and Gill it has been further limited to those types which have the hyperosteoroid impregnated and the fusion between the hyperosteoroid and the operosteoroid. It thus included the families *Gadidae* and *Moridae*. Also *Anacanthina*.

times applied to an ambo or a pulpit.—2. The inclosure of the tomb of a saint. *Du Cange*.

II. intrans. To make use of analogy; be analogous.

Also spelled *analogise*.

analogon (a-nal'ō-gon), *n.*; pl. *analogia* (-gŭi). [*< Gr. ἀναλογον*, adj., neut. of *ἀναλογος*, analogous: see *analogous*.] An analogue; something analogous. *Coleridge*.

Even the other element of the Jewish system, the element of prophecy, is not without its *analogon* among the heathen. *G. P. Fisher*, *Begin. of Christianity*, i.

analogous (a-nal'ō-gus), *a.* [*< L. analogus*, *< Gr. ἀναλογος*, according to a due λόγος or ratio, proportionate, conformable, analogous, *< ἀνά*, throughout, according to (see *ana-*), + *λόγος*, ratio, proportion: see *logos* and *logic*.] **1.** In general, having analogy; corresponding (to something else) in some particular or particulars, while differing in others; bearing some resemblance or proportion: sometimes loosely used for *similar*. Thus, there is something in the exercise of the mind *analogous* to that of the body; animal organs, as the wing of a bird and that of a bat, which perform the same function, though different in structure, are *analogous*. See 4, below.

The effect of historical reading is *analogous*, in many respects, to that produced by foreign travel.

Macaulay, *On History*.

Specifically—**2.** In *chem.*, closely alike, but differing in some degree as to each of the more prominent characters.—**3.** In *bot.*, resembling in form but not in plan of structure. Thus, the spur of a larkspur is *analogous* to one of the five spurs of a columbine, but they are not homologous, for the one is a sepal and the other a petal. *A. Gray*.

4. In *biol.*, similar physiologically but not anatomically; like in function but not in structure: the opposite of *homologous*. See *analogu*, 5.—**5.** In *logic*, from Albertus Magnus down to modern writers, applied to terms which are homonymous or equivocal in a special way, namely, those in which the identity of sound is not accidental, but is based upon a trope or upon some other reason.

A term is *analogous* whose single signification applies with equal propriety to more than one object; as, the leg of the table, the leg of the animal. *Whately*.

In all senses used with to, sometimes with. = *Syn.* Correspondent, similar, like.

analogously (a-nal'ō-gus-li), *adv.* In an analogous manner.

analogue (an'a-log), *n.* [*< F. analogue*, adj. and *n.*, *< L. analogus*, adj., analogous: see *analogous*.] **1.** In general, something having analogy to something else; an object having some agreement or correspondence in relations, functions, or structure with another object.

The mechanical law, that action and reaction are equal, has its moral *analogue*. *H. Spencer*, *Social Statics*, p. 253.

It [cynicism] is the intellectual *analogue* of the truffle; and though it may be very well in giving a relish to thought for certain palates, it cannot supply the substance of it. *Lowell*, *Study Windows*, p. 137.

Specifically—**2.** In *philol.*, a word corresponding with another; an analogous term.—**3.** In *zool.* and *bot.*, an animal or a plant corresponding in some special and essential attributes or relations to a member of another group or region, so that it is a representative or counterpart.—**4.** In *biol.*, an organ in one species or group having the same function as an organ of different structure and origin in another species or group. The difference between *homologue* and *analogue* may be illustrated by the relation between the wing of a bird and that of a butterfly: as the two differ totally in anatomical structure, they cannot be said to be *homologues*, but they are *analogues*, since both serve for flight. See *analogu*, 5.

analogy (a-nal'ō-jī), *n.*; pl. *analogies* (-jiz). [*< F. analogie*, *< L. analogia*, *< Gr. ἀναλογία*, equality of ratios, proportion, analogy, *< ἀνάλογος*, analogous: see *analogous*.] **1.** In *math.*, an equation between ratios. This use is obsolete except in a few phrases, as *Napier's analogies*, which are four important formulas of spherical trigonometry.

2. An agreement, likeness, or proportion between the relations of things to one another; hence, often, agreement or likeness of things themselves. *Analogy* strictly denotes only a partial similarity, as in some special circumstances or effects predicable of two or more things in other respects essentially different: thus, when we say that learning enlightens the mind, we recognize an *analogy* between learning and light, the former being to the mind what the latter is to the eye, enabling it to discover things before hidden. [We

say that there is an *analogy* between things, and that one thing has analogy to or with another.]

Intuitive perceptions in spiritual beings may, perhaps, hold some *analogy* unto vision.

Sir T. Browne, *Christ. Mor.*, iii, 15.

That there is a real *analogy* between an individual organism and a social organism, becomes undeniable when certain necessities determining structure are seen to govern them in common. *H. Spencer*, *Study of Sociol.*, p. 329.

In philosophy, *analogy* does not consist in the equality of two quantities, but of two qualitative relations.

Kant, *Critique of Pure Reason* (tr. by Max Muller).

Specifically—**3.** In *logic*, a form of reasoning in which, from the similarity of two or more things in certain particulars, their similarity in other particulars is inferred. Thus, the earth and Mars are both planets, nearly equidistant from the sun, not differing greatly in density, having similar distributions of seas and continents, alike in conditions of humidity, temperature, seasons, day and night, etc.; but the earth also supports organic life; hence Mars (probably) supports organic life. *is an argument from analogy*. See *induction*.

4. In *gram.*, conformity to the spirit, structure, or general rules of a language; similarity as respects any of the characteristics of a language, as derivation, inflection, spelling, pronunciation, etc.—**5.** In *biol.*, resemblance without affinity; physiological or adaptive likeness between things morphologically or structurally unlike: the opposite of *homology*. Thus, there is an analogy between the wing of a bird and that of a butterfly, both being adapted to the same physiological purpose of flight, but there is no morphological relation between them. *Analogy* rests upon mere functional (that is, physiological) modifications; *homology* is grounded upon structural (that is, morphological) identity or unity. *Analogy* is the correlative of physiology, *homology* of morphology; but the two may be coincident, as when structures identical in morphology are used for the same purposes and are therefore physiologically identical.—*Analogy of faith*, in *theol.*, the correspondence of the several parts of revelation with one another.

alphabet, alphabete (an-al'fa-bet, -bēt), *a.* and *n.* [*< ML. alphabetus*, *< Gr. ἀλφάβητος*, not knowing one's A B C, *< ἀλφ-priv.* + *ἀβήβητος*, the A B C, alphabet: see *alphabet*.] **I. a.** Not knowing the alphabet; illiterate.

II. n. One who does not know the alphabet; one who cannot read.

As late as the census of 1861 it was found that [in Italy] in a population of 21,777,331 there were no less than 16,999,701 *alphabetes*, or persons absolutely destitute of instruction, absolutely unable to read. *Encyc. Brit.*, XIII, 460.

alphabetetic (an-al'fa-bet'ik), *a.* Not knowing the alphabet; illiterate; unable to read.

analysable, analyse, etc. See *analyzable*, etc.

analyse, *n.* [Also written *analise*, *< F. analyse*, *< ML. analysis*: see *analysis*, *analyze*.] *Analysis*.

The *analyse* of it [a tractate] may be spared, since it is in many hands. *Bp. Hacket*, *Life of Alp. Williams*, ii, 104.

analysis (a-nal'i-sis), *n.* [Formerly *analyse*, *< F. analyse* = *Pg. analyse* or *analysis* = *Sp. análisis* = *It. analisi*, *< ML. analysis*, *< Gr. ἀνάλυσις*, a dissolving, resolution of a whole into its parts, solution of a problem, analysis, lit. a loosing, *< ἀνάλειν*, resolve into its elements, analyze, lit. loosen, undo, *< ἀνά*, back, + *λύνειν*, loosen: see *loosen*.] **1.** The resolution or separation of anything which is compound, as a conception, a sentence, a material substance, or an event, into its constituent elements or into its causes; decomposition.

In the deductive syllogism we proceed by *analysis*—that is, by decomposing a whole into its parts.

Sir W. Hamilton.

In the associationist psychology, the *analyses* of an idea is the discovery of the different kinds of elementary sensations which are associated together to produce the idea. *Mill*.

Analysis is real, as when a chemist separates two substances. Logical, as when we consider the properties of the sides and angles of a triangle separately, though we cannot think of a triangle without sides and angles. *Fleming*, *Vocab. of Phil.*

The *analysis* of a material object consists in breaking it up into those other material objects which are its elements, and it is only when we know something of the properties of these elements as they exist separately that we regard an *analysis* of the whole as satisfactory. *Mind*, IX, 80.

2. The regressive scientific method of discovery; research into causes; induction.—**3.** In *math.*: (a) Originally, and still frequently, a regressive method, said to have been invented by Plato, which first assumes the conclusion and gradually leads back to the premises. The thirteenth book of Euclid's *Elements* has the following definition, which is not supposed to be by Euclid, but which is ancient, and perhaps by Eudoxus: *Analysis* is the proceeding from the thing sought, as conceded, by consequences to some conceded truth; *synthesis* is the proceeding from the conceded by consequences to the truth sought. According to Pappus, *analysis* is of two kinds: *theoretical*, so called because used in research into truth, and *problematic*, so called because used in the solution of problems. In the former, the proposition to be proved is

assumed as true, and consequences are drawn from it until something conceded is reached, which if it is true involves the truth of the thing sought; the demonstration corresponding to the *analysis*. In the latter, the construction sought is assumed as already known, and consequences are deduced from it until something given is reached. (b) Algebraical reasoning, in which unknown quantities are operated upon in order to find their values. *Fuchs*. (c) The treatment of problems by a consideration of infinitesimals, or something equivalent, especially by the differential calculus (including the integral calculus, the calculus of variations, etc.); often called *infinitesimal analysis*. This is the common meaning of the word in modern times. Hence—(d) The discussion of a problem by means of algebra (in the sense of a system of symbols with rules of transformation), in opposition to a geometrical discussion of it, that is, a discussion resting directly upon the imagination of space: thus, analytical geometry is the treatment of geometrical problems by *analysis*.—**4.** A syllabus or synopsis of the contents of a book or discourse, or of the principles of a science.—*Analysis of a plant*, an examination of its structure and characters as a preliminary to its determination.—*Chemical analysis*, *Diophantine analysis*, etc. See the adjectives.—*Fluxional analysis*. See *method of fluxions*, under *fluxions*.—*Gasometric analysis*, *harmonic analysis*, etc. See the adjectives.—*Qualitative analysis*, in *chem.*, the detection of the constituents of a compound body, in distinction from *quantitative analysis*, or the determination of the amounts and proportions of the constituents.—*Spectrum analysis*. See *spectrum*. = *Syn. Assay, Analysis*. See *its say*.

analyst (an'a-list), *n.* [= *F. analyste* = *Pg. analista* = *Sp. It. analista*; formed from the verb *analyze*, as if from a verb in *-ize*: see *-ist, -ize*.] One who analyzes or who is versed in analysis, in any application of that word.

The *analyst* has not very many resources at his disposal for separating an intimate mixture of several bodies. *Pop. Sci. Mo.*, XXV, 203.

analytic, analytical (an-a-lit'ik, -i-kal), *a.* and (in the first form) *n.* [*< ML. analyticus*, *< Gr. ἀνάλυτικός*, analytic, *< ἀνάλυστος*, dissolvable, verbal adj. of *ἀνάλειν*, dissolve, resolve, analyze: see *analysis*.] **I. a.** **1.** Relating to, of the nature of, or operating by analysis: opposed to *synthetic*, *synthetical*: as, an *analytic* mode of thought.

His [Webster's] mind was *analytical* rather than constructive, and his restlessness of life was indicative of a certain instability of temper.

H. E. Scudder, *Noah Webster*, iv.

2. In the *Kantian logic*, explicatory; involving a mere analysis or explication of knowledge, and not any material addition to it.

In all judgments in which there is a relation between subject and predicate (I speak of affirmative judgments only, the application to negative ones being easy), that relation can be of two kinds. Either the predicate B belongs to the subject A as something contained (though covertly) in the concept A; or B lies outside of the sphere of the concept A, though somehow connected with it. In the former case I call the judgment *analytical*; in the latter, *synthetical*. *Analytical* judgments (affirmative) are therefore those in which the connection of the predicate with the subject is conceived through identity, while others in which that connection is conceived without identity may be called *synthetical*.

Kant, *Critique of Pure Reason* (tr. by Max Muller).

3. In *philol.*, deficient in inflections, and employing instead particles and auxiliary words to express modifications of meaning and to show the relations of words in a sentence: as, an *analytic* language.—*Analytical chemistry*, a method of physical research in which compound substances are resolved into their elements.—*Analytical definition*. See *definition*.—*Analytical geometry*, geometry treated by means of ordinary algebra, with a reference, direct or indirect, to a system of coordinates. See *coordinate*. In ordinary rectangular coordinates, for example, there is just one point of space for every set of values of the three variables, *x*, *y*, *z*. If, now, an equation is assumed between these variables, some of the sets of otherwise possible values will be excluded, and thus some of the points of space will be debarr'd to us, and we shall be restricted to a certain "locus" or place; and since the number of independent variables is, in consequence of the equation, reduced by one, the number of dimensions of the locus at any one point will be one less than that of space, so that the locus will be a surface. By the use of such equations of loci every problem of geometry is reduced to a problem of algebra, and the whole doctrine of geometry is mathematically identified with the algebra of three variables. Thus, to discover that, when two equations subsist between three unknown quantities, they can be satisfied simultaneously, amounts to discovering that, when a certain geometrical relation subsists between four surfaces, they meet in a common point. The idea of analytical geometry is exclusively due to the genius of Descartes (1596-1650), who published his *Geometrie*, containing illustrations of the new method, in 1636. *Analytical jurisprudence*, a theory and system of jurisprudence wrought out neither by inquiring for ethical principles or the dictates of the sentiment of justice, nor for the rules which may be actually in force, but by analyzing, classifying, and comparing various legal conceptions. The best known of the analytical jurists are Bentham and

Austin. — **Analytical key**, in *bot.*, an arrangement of the prominent characters of a group of orders, or of genera, etc., in such a manner as to facilitate the determination of plants. — **Analytical mechanics**, the science of mechanics treated by the infinitesimal calculus. — **Analytic function**. See *function*. — **Analytic method**, in *logic*, a method which proceeds regressively or inductively from known particulars to the recognition of general principles, in opposition to the *synthetic method*, which advances from principles to particulars.

II. n. (only in the first form). 1. One of the main divisions of *logic*, which treats of the criteria for distinguishing good and bad arguments. — 2. Analysis in the mathematical sense. [Rare.] — **The new analytic of logical forms**, a logical scheme of syllogism by Sir W. Hamilton, based upon the doctrine of the quantification of the predicate. See *quantification*.

analytically (an-a-lit'i-kal-i), *adv.* 1. In an analytical manner; by an analytic method; by means of analysis. — 2. To or toward analytic methods; as, "persons *analytically* inclined." *H. Spencer*.

analytically (an-a-lit'i-ks), *n. pl.* [The *pl.* form with ref. to Aristotle's treatises on logic, called *τὰ ἀναλυτικά*, neut. *pl.* of *ἀναλυτικός*, analytic; see *analytic*.] 1. The name given by Aristotle to the whole of his logical investigations viewed as the analysis of thought; specifically, the name of two of his logical treatises, the *Prior* and the *Posterior Analytics*, the former of which deals with the doctrine of the syllogism, and the latter with proof, definition, division, and the knowledge of principles. — 2. Same as *analytic*.

analyzable, analysable (an'a-li-za-bl), *a.* [*< analyze, analyse, + -able.*] Capable of being analyzed.

analyzableness, analysableness (an'a-li-za-bl-ness), *n.* The state or quality of being analyzable.

analyze, analyse (an'a-liz), *v. t.*; pret. and pp. *analyzed, analysed*, ppr. *analyzing, analysing*. [Now usually spelled *analyse* in England, but formerly there, as still in the United States, spelled regularly *analyze* (as in Johnson's Dictionary), in the 17th century also *analize*, < F. *analyser* = Pr. Pg. *analysar* = Sp. *analizar* = It. *analizzare*, analyze; from the noun, F. *analyse*, E. obs. *analyse*, analysis, the term conforming to *-ize*, as also in *paralyze*, q. v.: see *analysis* and *-ize*.] 1. To take to pieces; resolve into elements; separate, as a compound into its parts; ascertain the constituents or causes of; ascertain the characters or structure of, as a plant; as, to *analyze* a mineral, a sentence, or an argument; to *analyze* light by separating it into its prismatic constituents.

But do what we will, there remains in all deeply agreeable impressions a haunting something we cannot *analyze*. *H. James, Jr., Trans. Sketches*, p. 244.

The *analyzing* prism is fitted into the body of the microscope above the Wulff prism, in such a manner that, when its fitting is drawn out, . . . it is completely out of the way of the light-rays.

W. E. Carpenter, *Micros.*, § 68.

Hence — 2. To examine critically, so as to bring out the essential elements or give the essence of; as, to *analyze* a poem. — 3. In *math.*, to submit (a problem) to treatment by algebra, and especially by the calculus.

In *bot.*, an anomalous or monstrous development of any part of a plant, owing to some unusual condition affecting growth, so that it presents an appearance altogether unlike the typical form, as when the calyx of a rose assumes the form of a leaf. Lichens are so liable to this change of form from modifications of climate, soil, etc., that some varieties have been placed in three or four different genera.

3. In *zool.* and *bot.*, the gradual change of form, generally ascending, traced in a group of animals or plants the members of which succeed each other in point of time. Thus, the earlier members of any group observed in the lower geological formations are by some said to be of a lower type than, and in point of development inferior to, their analogues in more recent strata or among living forms; but this has been controverted, especially by opponents of Darwinism.

In senses 2 and 3 also called *anamorphism*.

Anamorphosis.

Hast, Well, what say you to a friend who would take the bitter bargain off your hand?

Tony, Anan! *Goldsmith, She Stoops to Conquer*, ii.

[In this sense formerly, and still dialectally, much used in replying to questions or commands, to gain a slight delay, though originally implying "I will attend to you at once"; hence, with an interrogative tone, it came to imply that the question or command was not understood. It is the same word as *anon*.]

anathema (a-nath'ē-mä), *n.*; pl. *anathemas*, *anathemata* (-mäz, an-a-them'a-tä). [LL. *anathēma*, < Gr. *ἀνάθημα* (in the Septuagint and the New Testament and hence in eccles. (Gr. and L.), anything devoted to evil, an accursed thing, a curse; esp. of excommunication, an accursed or excommunicated person; in classical Greek simply 'anything offered up or dedicated,' being another form of the regular *ἀνάθημα*, a votive offering set up in a temple, esp. as an ornament, hence also an ornament, a delight (> LL. *anathēma*, an offering, a gift), lit. 'that which is set up'; < *ἀνάθημι*, set up, dedicate, offer, < *ἀνα*, up, + *θήμι*, put, place, set: see *ana*- and *theme*.] The forms of *anathema* are thus distinguished: *anathema*, when the dedication is carried out by the preservation of the object as a pious offering (Luke xxi. 5); *anathema*, when it has in view the destruction of the object as accursed (Josh. vii. 12). A relic of the former and original sense of the word is found in the *anathēmata* of the middle ages, which were gifts and ornaments bestowed upon the church and con-

separated to the worship of God. The principal English uses, however, are derived from the form *anathema*.] 1. A person or thing held to be accursed or devoted to damnation or destruction.

The Jewish nation was an *anathema* destined to destruction. St. Paul . . . says he could wish to save them from it, and to become an *anathema*, and to be destroyed himself.

Locke, Paraphrase of Rom. ix. 3.

It is God's will, the Holy Father's will,
And Philip's will, and mine, that he should burn.
He is pronounced *anathema*.

Tennyson, Queen Mary, iv. 1.

2. A curse or denunciation pronounced with religious solemnity by ecclesiastical authority, involving excommunication. This species of excommunication was practised in the ancient churches against incorrigible offenders. Churches were warned not to receive them, magistrates and private persons were admonished not to harbor or maintain them, and priests were enjoined not to converse with them or attend their funerals. Also called *judiciary anathema*. The formula, "which if anybody deny let him be *anathema*," is commonly added to the decrees of ecclesiastical councils, and especially to the doctrinal canons of ecumenical councils. It is denied by some theologians that the idea of a curse properly belongs to the anathema as used in the Christian church. See *excommunication*.

In pronouncing *anathema* against wilful heretics, the Church does but declare that they are excluded from her communion, and that they must, if they continue obstinate, perish eternally. Cath. Dict.

Hence—3. Any imprecation of divine punishment; a curse; an execration.

4. Anything devoted to religious uses.—*Abjuratory anathema*, the act of a convert who anathematizes the heresy which he abjures. *Anathema maranatha* (mar-an-á-tha, prop. ma-ran'-á-thá'). [LL. (Vulgate) *anathema*, *Maran atha*, < Gr. ἀνάθεμα, μαράν ἄθα, prop. separated by a period, being the end of a sentence, Gr. ἦτο ἀνάθεμα, LL. *sit anathema*, let him be anathema, followed by another sentence, μαράν ἄθα, < Syr. *maran' etha*, lit. the Lord hath come, here used appar. as a solemn formula of confirmation, like *amen*, q. v.] A phrase, properly two separate words (see etymology), occurring in the following passage, where it is popularly regarded (and hence sometimes elsewhere used) as an intenser form of *anathema*.

If any man love not the Lord Jesus Christ, let him be *Anathema Maran-atha*. [Revised version, "let him be anathemat. Maran atha."] 1 Cor. xvi. 22.

They are commonly divided into 5 subfamilies: *Cygninae*, the swans; *Anserinae*, the geese; *Anatinae*, the river or fresh-water ducks; *Fuligininae*, the sea ducks, and *Merginae*, the mergansers. There are upward of 175 species, representing about 70 modern genera or subgenera, of all parts of the world, and commonly called collectively *water-fowl*. A distinctive character is the lamellate or toothed bill, invested with a tough corneous integument hardened at the end into a more or less distinct nail, whence the *Anatidæ* are sometimes called *Unguiculates*. The technical characters are: short legs, more or less posterior, buried beyond the knees in the common integument, and feathered nearly or quite to the subtrochanteral or reticulate, or both; feet palmate and 4-toed; hallux free, simple or lobed; desmognathous palate; sessile oval basipterygoid fangs; the angle of the mandible produced and recurved; oil-gland present; two carotids; the tongue large and fleshy, with a greatly developed glossy bone and lateral processes corresponding to the lamellæ of the bill; and the trachea sometimes folded in an excavation of the breast bone.

The name is derived from some fancied resemblance of the *Lepas anatifa* to a bird, whence arose the vulgar error that the barnacle-geese, *Anas* or *Anser bernicla*, was produced from this cirriped, which was supposed to turn into the bird when it dropped from the tree upon which it was fabled to grow. [Disused.] See *Lepadidæ*, *Lepas*.

They are separated from the *Fuliginæ*, or sea-ducks, by having the hallux simple, not lobed. The name *Anatinæ* has occasionally been used to distinguish the "ducks," collectively, from other *Anatidæ*, as the swans, geese, and mergansers; in this use it includes the *Fuliginæ*. The *Anatinæ* proper include the mallard (*Anas boschas*), the wild original of domestic ducks, and many other species, as the widgeon, gadwall, pintail, shoveler, wood-duck, and the various kinds of teal. and (and, unaccented and: see *an*), *conj.*

[< ME. *and*, *ant*, *an*, sometimes *a*, < AS. *and*, *ond*, rarely *end* (in AS. and ME. usually expressed by the abbrev. symbol or ligature *⁊*, later *⁊* (mod. &), for L. *et*, and), = OS. *endi*, rarely *en*, = OFries. *anda*, *ande*, and, *an*, rarely *ond*, also *ende*, *enda*, *end*, *en*, mod. The Teut. prepositions and prefixes containing a radical *n* tended to melt into one another both as to form and sense. There appear to have been orig. two forms of *and*, namely, (a) AS. *and*, *ond*, OS. *ant*, Goth. *and*, *anda*, Teut. **anda-*, and (b) AS. *end*, OS. *endi*, etc., Teut. **andi-*, the latter being = L. *ante*, before, = Gr. *ἀντί*, against, = Skt. *anti*, over against, near, related with *anta*, *end*, = Goth. *andis* = AS. *ende*, E. *end*: see *end*, and cf. *andiron*. See *an-*, *an-*, *ante-*, *anti-*, prefixes ult. identical. For the transition from the prep. *and*, before, besides, with, to the conj. *and*, and cf. the prep. *with* in such constructions as "The passengers, with all but three of the crew, were saved," where and may be substituted for *with*. From the earliest ME. period *and* has also existed in the reduced form *an*: see *an*.] **A. Coördinate use.** 1. Connective: A word connecting a word, phrase, clause, or sentence with that which precedes it: a colorless particle without an exact synonym in English, but expressed approximately by 'with, along with, together with, besides, also, moreover,' the elements connected being grammatically coördinate.

In our last conflict four of his five wits went halting off, and now is the whole man governed with one.

Shak., *Much Ado*, i. 1.

We have been up *and* down to seek him.

Shak., M. of V., iii. 1.

His fame *and* fate shall be

An echo *and* a light unto eternity.

Shelley, Adonais, l. 8.

Along the heath *and* near his favorite tree.

Gray, Elegy, l. 110.

When many words, phrases, clauses, or sentences are connected, the connective is now generally omitted before all except the last, unless retained for rhetorical effect. The connected elements are sometimes identical, expressing continuous repetition, either definitely, as, to walk two *and* two; or indefinitely, as, for ever *and* ever, to wait years *and* years.

To-morrow, *and* to-morrow, *and* to-morrow,
Creeps in this petty pace from day to day,
To the last syllable of recorded time.

Shak., Macbeth, v. 5.

The repetition often implies a difference of quality under the same name: as, there are deacons *and* deacons (that is, according to the proverb, "There's odds in deacons"); there are novels *and* novels (that is, all sorts of novels). To make the connection distinctly inclusive, the term *both* precedes the first member: as, *both* in England *and* in France. For this, by a Latinism, *and* . . . has been sometimes used in poetry (Latin and French . . . *et*).

Thrones and civil and divine.

Sylvester, tr. of Du Bartas.

2. Introductory: in continuation of a previous sentence expressed, implied, or understood.

And the Lord spake unto Moses.

Num. i. 1.

And he said unto Moses.

Ex. xiv. 1.

In this use, especially in continuation of the statement implied by assent to a previous question. The continuation may mark surprise, incredulity, indignation, etc.: as, *And* shall I see him again? *And* you dare thus address me?

And do you now put on your best attire,
And do you now call out a holiday,
And do you now strew flowers in his way,
That comes in triumph over Pompey's blood?

Shak., J. C. i. 1.

Alas! *and* did my Saviour bleed?

Watts.

3. Adverbial: Also; even. [Rare; in imitation of the Latin *et* in like use.]

He that hateth me, hateth *and* [also, *Parv.*] my father.

Wyclif, John xv. 23 (Oxf. ed.).

Not only he brak the saboth, but *and* [but, *Parv.*] he seide his father God.

Wyclif, John v. 18.

Hence, *but and*, and also: common in the old ballads.

And they hae chased in gude green-wood
The buck *but* and the rae.

Rose the Red, and White Lily.

Child's Ballads, III. 180.

She brought to him her beauty and truth,
But and broad earldoms three.

Lowell, Singing Leaves.

B. Conditional use. [In this use not found in AS., but very common in ME.; cf. Icel. *und* and MHG. *unde* in similar use: a development of the coördinate use; cf. *so*, adv. conj., marking continuation, with *so*, conditional conj., if. This *and*, though identical with the coördinate, has been looked upon as a different word, and in modern editions is often artificially discriminated by being printed *an*: see *an*2.] If; supposing that; as, *and* you please. [Common in the older literature, but in actual speech now only dialectal.]

For, *and* I sholde rekenen every vice

Which that she hath, ywis I were to nice.

Chaucer, Prologue to Squire's Tale, l. 15.

Disadvantage *ys*, that now children of gramer-scole coneth no more frensch than can here lift [their left] heele, & that is harm for ham [them] & a [if they] scholle passe the se, & traawayk in strange londes.

Trevisa, tr. of Higden, Polychron., l. lxix.

And I suffer this, may I go graze.

Fletcher, Woman's Prize, l. 3.

Often with added *if* (whence mod. dial. *an if*, *nif*, if). Hence, *but and if*, but if.

But and if that servant say.

Luke xii. 45.

II. *n.* 1. A name early given to a substance (e. g., a metal) which apparently does not become electrified by friction when held in the hand. This was afterward proved to be due to the conductivity of the substance, the electricity generated passing off immediately to the ground.

Hence—2. A conductor, in distinction from a non-conductor or insulator.

anelectrode (an-ē-lek'trōd), *n.* [*< Gr. ἀνά*, up (*an-*6), + *electrode*, q. v. Cf. *anode*.] The posi-

anelectrotonus (an-ē-lek-trōt'ō-nus), *n.* [*< Gr. ἀν-* priv. + *ελεκτρον*, amber, implying *electric*, q. v.), + *τονος*, strain: see *tone*.] The peculiar condition of a nerve (or muscle) in the neighborhood of the anode of a constant electric current passing through a portion of it. The irritability is diminished, the electrical potentials are increased, and the conductivity for nervous impulses is diminished. The wave of lowered potential which attends a nervous impulse and gives rise to currents of action diminishes in going from a region of greater to one of less conductivity, and increases in going in the opposite direction. The nervous impulse itself presumably behaves in the same way.

It then presents itself in the forms of oligocythæmia, achrocythæmia, microcythæmia, and hydremia, simply or combined. See these words. Idiopathic anemia, a disease characterized by anemia advancing without interruption to a fatal issue, without evident cause, and associated with fever and such symptoms as would result from anemia however produced, as palpitation, dyspnea, fainting fits, dropsy, etc. It is more common in women than in men, and most frequent between 20 and 40 years of age. *Casella's portable anemometer, designed for measuring the velocity of air-currents in mines and ventilating shafts, consists of a wind-wheel attached to a counting arrangement. Anemometers for indicating velocity are commonly formed of plane surfaces or drums exposed to the wind, and so arranged as to yield to its pressure, and indicate the amount by their movements. Lind's anemometer consists of a glass tube bent into the form of an inverted siphon graduated, partly filled with water, and mounted as a weathercock. To one of its open ends a metallic cylinder of the same bore as the tube is attached at right angles. The pressure of the wind blowing into this causes the water to sink in one arm of the tube and to rise in the other, and the difference of level of the two columns of water, which is measured by the amount of fall plus the amount of rise, as shown by the graduated scales, gives the force or pressure of the wind. By the use of mechanical or electrical appliances anemometers may be made to record as well as measure variations in the velocity and pressure of the wind. When they record the velocity or direction, or both, they are sometimes called *anemographs*; when they indicate the direction only, they are called *anemoscopes*; when they automatically record velocity, direction, and pressure, they are called *anemometographs* or *anemometrographic centers*.*

Anemophilous flowers, as a rule, are small, uncolored, and inconspicuous, and do not secrete honey, but produce a great abundance of pollen. The flowers of the grasses, sedges, pine-trees, etc., are examples.

The amount of pollen produced by anemophilous plants, and the distance to which it is often transported by the wind, are both surprisingly great.

= Syn. *Anger*, *Excitation*, *Indignation*, *Resentment*, *Wrath*, *Ire*, *Choler*, *Rage*, *Fury*, passion, displeasure, dudgeon, irritation, gall, bile, spleen. *Vexation* is the least forcible of these words, expressing the annoyance and impatient chafing of one whose mood has been crossed, whose expectations have not been realized, etc. *Indignation* may be the most high-minded and unselfish; it is intense feeling in view of grossly unworthy conduct, whether toward one's self or toward others. The other words denote almost exclusively feeling excited by the sense of personal injury. *Anger* is a sudden violent feeling of displeasure over injury, disobedience, etc., accompanied by a retaliatory impulse; it easily becomes excessive, and its manifestation is generally accompanied by a loss of self-control. *Resentment* is the broadest in its meaning, denoting the instinctive and proper recoil of feeling when one is injured, and often a deep and bitter brooding over past wrongs, with a consequent hatred and settled desire for vengeance; it is, in the latter sense, the coolest and most permanent of these feelings. *Wrath* and *ire* express sudden feeling of great power, and are often associated with the notion of the superiority of the person: as, the *wrath* of Jove, the *ire* of Achilles. They are often the result of wounded pride. *Ire* is poetic. *Wrath* has also an exalted sense, expressive of a lofty indignation visiting justice upon wrong-doing. *Rage* is an outburst of anger, with little or no self-control; *fury* is even more violent than *rage*, rising almost to madness. The chief characteristic of *choler* is quickness to rise; it is irascibility, easily breaking into a high degree of resentful feeling.

White was her cheek; sharp breaths of *anger* puff'd
Her fairy nostril out. Tennyson, Merlin and Vivien.

One who falls in some simple mechanical action feels *vexation* at his own inability — a *vexation* arising quite apart from any importance of the end missed.

Burning with *indignation*, and rendered sullen by despair, . . . they refused to ask their lives at the hands of an insulting foe, and preferred death to submission.

Irving, Indian Character.

When the injury he resented was a personal one, he apologized frankly for his *anger*, if it had transgressed the bounds of Christian *indignation*; but when he was indignant with falsehood, injustice, or cowardly wrong done to another, it was terrible to see his whole face knit itself together with *wrath*. S. A. Brooke, F. W. Robertson, II. ii.

To be angry about trifles is mean and childish; to rage and be furious is brutish; and to maintain perpetual *wrath* is akin to the practice and temper of devils; but to prevent and suppress rising *resentment* is wise and glorious, is manly and divine. Watts.

Angle² (ang'gl), *n.* [In mod. use only as a historical term; < L. *Anglus*, usually in pl. *Angli* (first in Tacitus), repr. the OTeut. form found in AS. *Angle*, *Engle*, *Engle*, reg. *Engle*, pl. (in comp. *Angel*, *Onge*), the people of *Angel*, *Angol*, *Angul*, *Onge* (= Icel. *Öngull*), a district of what is now Schleswig-Holstein, said to be so named from *angel*, *angul*, *ongul*, a hook, in ref. to its shape: see *angle*¹. Hence *Anglo*, *Anglo-Saxon*, *English*, q. v.] One of a Teutonic tribe which in the earliest period of its recorded history dwelt in the neighborhood of the district now called Angeln, in Schleswig-Holstein, and which in the fifth century and later, accompanied by kindred tribes, the Saxons, Jutes, and Frisians, crossed over to Britain and colonized the greater part of it. The Angles were the most numerous of these settlers, and founded the three kingdoms of East Anglia, Mercia, and Northumbria. From them the entire country derived its name *England*, the "land of the Angles." See *Anglian*, *Anglo-Saxon*, and *English*.

angle³ (ang'gl), *n.* [< ME. *angle*, *angel*, sometimes *angul*, < OF. *angle* = Fr. *angle* = Sp. 1. The difference in direction of two intersecting lines; the space included between two intersecting lines; the figure or projection formed by the meeting of two lines; a corner. In geom., a plane angle is one formed by two lines, straight or curved, which meet in a plane; a rectilinear angle, one formed by two straight lines. The point where the lines meet is called the *vertex* of the angle, or the *angular point*, and the lines which contain the angle are called its *sides* or *legs*. The magnitude of the angle does not depend upon the length of the lines which form it, but merely on their relative positions. It is measured by the length of a circular arc of unit radius having for its center the vertex of

Fig. 1.

the angle, or point of intersection of the sides. Thus, the angle AOB, fig. 1, is measured by 32 degrees of the circumference of the arc A'B'. Angular magnitudes are also expressed in *quadrants* of four to the circumference, in *hours* of six to the quadrant, in *centesimal degrees* of 90 to the quadrant, (rarely) in *centesimal degrees* of 100 to the quadrant, etc. The arc whose length is equal to the radius subtends an angle of 57.174 8 nearly. The ordinary measure of an angle is the logarithm of the anharmonic ratio made by the two sides with the two tangents to the absolute intersecting at the vertex. Angles receive different names, according to their magnitude, their construction, their position, etc. When one straight line in-

tersects another so as to make the four angles so formed equal, these angles are called *right angles*, and each is measured by an arc equal to one-fourth of a circumference, or 90 degrees.

Thus, ACD, fig. 2, is a *right angle*. An angle which is less than a right angle is *acute*, as ABE. An *obtuse* angle is one which is greater than a right angle, as ECF. *Acute* and *obtuse* angles are both called *oblique*, in opposition to *right* angles. A *circular* angle is formed by the meeting of the tangents to two curved lines at their point of intersection. *Adjacent* or *contiguous* angles are such as have one leg common to both angles, both to-

gether being equal to two right angles. Thus, in fig. 2, ACE and ECB are *adjacent angles*. *Complement* angles are two angles having a common vertex and common legs, one being concave, the other convex. A *straight* angle is an angle of 180°. A *reflex* angle is the same as a convex angle. (See *complement*, above.) *Exterior*, *external*, or *outward* angles are the angles of any rectilinear figure without it, made by producing one of the sides at each vertex, the angles formed within the figure being called *interior* angles. When one line intersects a pair of lines in a plane, of the eight angles so formed, those which are between the pair are called *interior*, those without *exterior*. Of the interior angles, a pair for different sides of the intersecting line, and at different intersected lines, are called *alternate* (which see). See *radian*.

Hence—2. An angular projection; a projecting corner: as, the *angles* of a building.—3. In *astrology*, the 1st, 4th, 7th, or 10th house.—4. In *anat.*, same as *angulus*.—5. In *her.*, a charge representing a narrow band or ribbon bent in an angle.

The term frequently occurs in the charters of Alfred and his successors (chiefly in the gen. pl. with *rex*) as the general name of their people, all the Teutonic tribes in England; but it is sometimes confined to the people south of the Humber. Cf. *D. Angelsakser*, *n.*, *-saksisch*, *a.*, *Sw. Angelsaksare*, *n.*, *Angelsaksisk*, *a.*, *Dan. Angelsaksers*, *n.*, *Angelsaksisk*, *a.*, based on the G. *Angelsachse*, pl. *-en*, *n.*, *Angelsächsisch*, *a.*; all mod.] **I. n. 1. (a)** Literally, one of the Angle or 'English' Saxons; sometimes restricted to the Saxons who dwelt chiefly in the southern districts (Wessex, Essex, Sussex, Middlesex—names which contain a form of *Saxon*—and Kent) of the country which came to be known, from a kindred tribe, as the land of the Angles, *Engla land*, now *England*, but usually extended to the whole people or nation formed by the aggregation of the Angles, Saxons, and other early Teutonic settlers in Britain, or the whole people of England before the conquest. (b) *pl.* The English race; all persons in Great Britain and Ireland, in the United States, and in their dependencies, who belong, actually or nominally, nearly or remotely, to the Teutonic stock of England; in the widest use, all English-speaking or English-appearing people. — **2.** [The adj. used absolutely.] The language of the Anglo-Saxons; Saxon; the earliest form of the English language, constituting, with Old Saxon, Old Friesic, and other dialects, the Old Low German group, belonging to the so-called West Germanic division of the Teutonic speech. The first Anglo-Saxon dialect to receive literary cultivation was that of the Angles (Anglo-Saxon *Engle*, *Engle*); hence the name *Englisc*, *Englisc*, that is, *Anglisc*, was afterward applied to all the dialects, and particularly to the prevailing one, West Saxon; it is the origin of the name *English* as applied to the modern mixed language. (See *English* and *English*.) A Middle Latin name for the language was *lingua Saxonica*, or *lingua Saxanum* or *Anglosaxanum*. The Anglo-Saxon language, in the widest use of the name, consisted of several dialects: the Northern or Anglian group, including the Old Northumbrian and the Midland or Mercian dialects, and the Southern or Saxon group, including the West Saxon and the Kentish. The Kentish remains are scanty, the Mercian scantier still and doubtful, while the Old Northumbrian remains are considerable. The great bulk of the Anglo-Saxon literature is West Saxon, the two terms being practically synonymous except when expressly distinguished as generic and specific. In the Old or Middle English period the Midland dialect became conspicuous, and it is to it that the form of modern English is chiefly due. In this dictionary *Anglo-Saxon* (abbreviated AS.) includes the whole language (but chiefly West Saxon, the Old Northumbrian and Kentish being discriminated when necessary) from the middle of the fifth century, or rather from the seventh century, when the first contemporary records begin, to the middle or end of the twelfth century; the language from the conquest (1066) to the end of this period being 'late Anglo-Saxon.' See *English*.

Several of the English scholars who are most active in the study of early English wage war on *Anglo-Saxon*. They attack the word. . . They are still more hostile to the suggestion which goes with the word, that the speech called *Anglo-Saxon* is different from modern English, so as to deserve a separate name. They say there has been but one speech spoken in England by the Teutonic tribes and their descendants from Cædmon to Temyson. . . This classic *Anglo-Saxon* differs from our English in phonology, . . . in vocabulary, . . . [in] inflections, . . . in the derivation of words, . . . [in] syntax, . . . [in] versification [see *alliteration*], . . . [and in] the modes of thought. . . The former is a synthetic German speech, with its own periods of early irregular idiom, classic cultivation, decline and fall into dialects; the latter an analytic mixed speech of Romance cultivation, with other periods of growth, and classic regularity and progress. And a chaos separates the two languages. It is only when attention is directed to the history of etymological forms that unity can be plausibly claimed for them. . . But while the importance of these forms in tracing the descent of languages is probably not overrated, their weight in establishing identity or similarity may easily be. . . The proposed use of *Old English* [in place of *Anglo-Saxon*] does not distinguish, but confounds all the periods of *Anglo-Saxon* and the two early periods of English. . . The reasons urged for this nomenclature are in great part sentimental. It is thought to magnify the English language and race to represent

them as Low German, having an unbroken history parallel with that of the High German, and reaching through a more famous career to a more venerable antiquity. But Americans are taught to believe in mixed races, and it magnifies the English most in our eyes to represent it in the old fashion, as formed by the junction of two great languages, the bearers of the best cultivation of the Teutonic and Romance races.

anharmonic (an-hār-mon'ik), *a.* [= F. *anharmonique*; < Gr. *ἀν-priv.* (an-ō) + *harmonia*, q. v.] Not harmonic; in *geom.*, a term applied by Chasles to an important kind of ratio introduced into geometry by Möbius. If *a, x, y, b* are four values of a unidimensional variable (for instance, the positions of four points on a line), then $\frac{(x-a)(y-b)}{(a-b)(y-x)}$ is called the *anharmonic ratio* of the four values. The intersections of a plane pencil of four lines with a transversal have the same anharmonic ratio; however the transversal may be situated; and this ratio is called the *anharmonic ratio* of the pencil. Anharmonic ratios are always preserved in orthographic projections. By means of these ratios, metrical properties are defined as projective properties of the absolute, or conic at infinity. See *absolute*, n., 2. If from the intersection of two lines tangents are drawn to the absolute, the logarithm of the anharmonic ratio of the pencil so formed multiplied by $\frac{1}{2}$ is the angle of the first two lines. So, the logarithm of the anharmonic ratio of two points, together with the intersections of their connecting line with the absolute, when multiplied by a constant, gives the distance of these points.—**Anharmonic property**, in *geom.*, a property that is connected with an anharmonic ratio.

aniline (an'i-lin), *n.* and *a.* [*< anil* (with reference to the brilliant violet and indigo dyes which, with others, are prepared from aniline) + -ine².] **I.** *n.* Amidobenzol, $C_6H_5NH_2$, a substance which furnishes a number of brilliant dyes. It was discovered in 1826 by Unverdorben, as a product of the distillation of nitrobenzol, and called by him *crystallin*. It did not acquire commercial importance until 1856, when the purple dye mauve was prepared from it by Perkins. It is found in small quantities in coal-tar, but the aniline of commerce is obtained from benzol, another product of coal-tar, consisting of hydrogen and carbon, C_6H_6 . Benzol when acted on by nitric acid produces nitrobenzol; and this latter substance when treated with nascent hydrogen, usually generated by the action of acetic acid upon iron filings or scraps, produces aniline, which is an oily liquid, colorless when pure, somewhat heavier than water, having a peculiar vinous smell and a burning taste. It is a strong base, and yields well-characterized salts. When acted on by arsenic acid, potassium bichromate, stannic chloride, etc., aniline produces a great variety of compounds of very beautiful colors, known by the names of aniline purple, aniline green, violet, magenta, etc. Also called *anilia*.

II. *a.* Pertaining to or derived from aniline: as, *aniline colors*. Aniline oil, a by-product of the manufacture of aniline, containing aniline, toluidine, and a number of other organic bases of the aromatic series. The corresponding acids represent one or more molecules of water in which the same radicals replace one half of the hydrogen. Thus, water being H₂O, sulphuric anhydride is SO₃ (or SO₃O), representing H₂O in which H₂ is replaced by the bivalent radical SO₃; while sulphuric acid is H₂SO₄ (or H₂SO₃O₂), representing 2H₂O in which two hydrogen atoms are replaced by SO₃ and two remain. They are more precisely called *acid anhydrides*. The basic anhydrides, in which the hydrogen is replaced by positive or basic radicals, are commonly called *metalloxides*.

animal (an'i-mal), *a.* and *n.* [First in 16th century: (*a*) *animal* (*any*mal, *animal*) = *F. Sp. Pg. animal* = *It. animale*, adj. *< L. animatus*, animate, living (also aérial, consisting of air), *< anima*, a current of air, wind, air, breath, the vital principle, life, soul: see *anima*; (*b*) *animal*, *n.* = *F. animal* = *Sp. Pg. animal* = *It. animale*, *< L. animal*, rarely *animale*, a living being, an animal in the widest sense, but sometimes restricted to a brute or beast; hence, in contempt, a human being; orig. neut. of *animatus*, adj., as above. In mod. use *animal*, *a.*, 'living, animate' is inseparably mixed with *animal*, *n.*, used attributively in the sense of 'pertaining to animals.'] 1. *a.* 1. Pertaining to sensation. See *animal spirits*, below.—2. Having life; living; animate.—3. Pertaining to the merely sentient part of a living being, as distinguished from the intellectual, rational, or spiritual part; of man, pertaining to those parts of his nature which he shares with inferior animals.

Good humour, frankness, generosity, active courage, sanguine energy, buoyancy of temper, are the usual and appropriate accompaniments of a vigorous *animal* temperament. *Locke, Europ. Morals*, II, 132.

Animal economy, the physiological course of events in the life of an animal; the sequence of cause and effect observed in the vital activities of animals; the order of animated nature. **Animal electricity**, electricity generated in animal bodies, as, in large quantities, in the electric eel, the torpedo, and *Malpighian*, or, in small quantities, in nervous, muscular, and other tissues. **Animal food**, flesh or any other part of an animal which is eaten.—**Animal force.** See *force*.—**Animal function**, any vital activity or physiological process performed in animal economy; any organic property or character of animals. Such functions may be grouped in a few broad classes: (1) Mentality, including all activities of the mind as distinguished from those of the body, such as instinct, reason, intellection, ideation, etc. (2) Sensibility, or feeling; the capability of responding automatically to external stimuli; irritability; insensibility: common to all animals in a high degree as compared with plants. (3) Locomotion, usual in animals, but unusual in plants. (4) Nutrition, involving interstitial growth and waste and repair: common to plants and animals, but usually differently effected in the two, and with different material. (5) Reproduction, or generation, a process whereby growth is devoted to the formation of separate individuals. Functions shared by all organized beings are called *organic* or *vegetative* functions; no functions are peculiar to animals except those of mentality. Other lesser categories of functions are sometimes named: as, the *digestive* function; the *sexual* function; the function of *circulation*, of *respiration*; the function of the liver, or of any part or organ, that is, the special part which it takes in the animal economy.—**Animal heat**, the temperature maintained during life in an animal body, and requisite for its physiological functions. It varies from a degree not appreciably different from that of the element in which the animal lives to one much higher, the latter being the case with the higher animals. Difference in degree of animal heat is the ground of a division of the higher animals into warm-blooded and cold-blooded, or *Hæmatotheria* and *Psittacotheria*. In the former a very sensibly elevated temperature is maintained. It is highest in birds, mounting sometimes to 112° F. In mammals a usual range is from 96° to 104° F. In man the mean normal temperature is about 99°, any considerable deviation from which is inconsistent with health. Animal heat is simply a case of chemical combustion; an analogous process goes on in plants. It is an index of the molecular motion of the body, and a measure of the work done by an animal in its vital activities.—**Animal kingdom**, all animals collectively; *Animalia*; one of the three grand divisions of the realm of nature (*imperium nature*), the other two comprising plants and minerals respectively. For scientific purposes it has been divided into classes, orders, families, genera, species, and groups (with intermediate divisions often formed by prefixing *sub-* or *super-* to these words), whereby the classification and registration of animals are facilitated. Examples of the primary divisions are the following: (1) The Linnean system (1766) divided animals into six classes: I. *Mammalia*; II. *Aves*; III. *Amphibia*; IV. *Pisces*; V. *Insecta*; VI. *Vermes*. (2) The system of Cuvier (1817) proposed 4 subkingdoms and 20 classes: I. *Vertebrata* (*Mammalia*, *Aves*, *Reptilia*, *Pisces*); II. *Mollusca* (*Cephalopoda*, *Pteropoda*, *Gasteropoda*, *Acephala*, *Brachiopoda*, *Cirrhopoda*); III. *Articulata* (*Annelides*, *Crustacea*, *Tribolita*, *Arachnida*, *Insecta*); IV. *Radiata* (*Echinodermata*, *Entozoa*, *Acalepha*, *Polypi*, *Infusoria*). (3) The system of Owen (1860) separated the Protozoa from *Animalia* proper as a separate kingdom, the latter being then divided into subkingdom I., *Invertebrata*, with 3 provinces, *Radiata*, *Articulata*, *Mollusca*; and subkingdom II., *Vertebrata*. (4) In 1869 Huxley arranged the animal kingdom in the 8 primary groups *Vertebrata*, *Mollusca*, *Mollusca*, *Calentata*, *Annulosa*, *Annuloida*, *Infusoria*, *Protozoa*. No two authorities agree upon the leading divisions of the animal kingdom, but a system like the following is now quite generally accepted: Subkingdom A (with one phylum), *Protozoa*: class I., *Rhizopoda*; class II., *Gregarinida*; class III., *Infusoria*. Subkingdom B, *Metazoa*. Phylum 1, *Calentata*: class IV., *Spongiopoda*; class V., *Hydrozoa*; class VI., *Actinopoda*; class VII., *Ctenozoa*. Phylum 2, *Echinodermata*: class VIII., *Crinoida*; class IX., *Asteroida*; class X., *Echinoida*; class XI., *Holothuroidea*. Phylum 3, *Vermes*: class XII., *Plathelminthes*; class XIII., *Nemathelminthes*; class XIV., *Gephyrea*; class XV., *Annelida*; class XVI., *Rotifera*. Phylum 4, *Arthropoda*: class XVII., *Crustacea*; class XVIII., *Arachnida*; class XIX., *Myriapoda*; class XX., *Insecta*. Phylum 5, *Mollusca*: class XXI., *Polyzoa*; class XXII., *Brachiopoda*. Phylum 6, *Mollusca*: class XXIII., *Acephala*; class XXIV., *Pteropoda*; class XXV., *Gasteropoda*; class XXVI., *Cephalopoda*. Phylum 7, *Vertebrata*: class XXVII., *Tunicata*; class XXVIII., *Leptocardia*; class XXIX., *Marsipobranchii*; class XXX., *Elasmobranchii*; class XXXI., *Pisces*; class XXXII., *Amphibia*; class XXXIII., *Reptilia*; class XXXIV., *Aves*; class XXXV., *Mammalia*. Three remarkable genera, *Dicynodon*, *Saurodon*, and *Salicoglossus*, are severally regarded by many authors as types of classes.—**Animal magnetism, mechanics**, etc. See the nouns. **Animal power**, the unit of power in men and animals, as *man-power*, *horse-power*, etc. Usually expressed in foot-pounds. See *horse-power*.—**Animal spirits**. (a) According to the doctrine of Galen, modified by Descartes, subtle and almost incorporeal parts of the living body, which penetrate the pores of the nerves and pass between the brain and the periphery, acting as the agents of volition and sensation. Also in the singular, *animal spirit*, equivalent to nervous force or action. (b) In modern use, exuberance of health and life; natural buoyancy; cheerfulness, animation, gaiety, and good humor.

Animal spirits constitute the power of the present, and their feats are like the structure of a pyramid.

Emerson, Society and Solitude.

II. *n.* 1. A sentient living being; an individual, organized, animated, and sentient portion of matter; in *zool.*, one of the *Animalia*; a member of the animal kingdom, as distinguished from a vegetable or a mineral. The distinction from the latter is sufficient, consisting in organization, interstitial nutrition, vitality, and animation; but it is impossible to draw any line between all vegetables and all

animals. Any criteria which may be diagnostic in most instances fail of applicability to the lowest forms of animal and vegetable life; and no definition which has been attempted has been entirely successful. Most animals are locomotory as well as motile, most plants are fixed. Most animals exhibit distinct active and apparently conscious or voluntary movements in response to irritation, mechanical or other; most plants do not. Most animals feed upon other animals or upon plants, that is to say, upon organic matter; most plants, upon inorganic substances. Most animals have no cellulose in their composition, nitrogenous compounds prevailing; while cellulose is highly characteristic of plants. Most animals inhale oxygen and exhale carbon dioxide, the reverse of the usual process in plants; and few animals have chlorophyll, which is so generally present in plants. Animals have usually a digestive cavity and a nervous system, and are capable of certain manifestations of consciousness, sentience, and volition, which can be attributed to plants only by great latitude in the use of the terms. See also *extract*.

Ordinary animals . . . not only possess conspicuous locomotive activity, but their parts readily alter their form or position when irritated. Their nutriment, consisting of other animals and of plants, is taken in the solid form into a digestive cavity. . . . Traced down to their lowest terms, the series of plant forms gradually lose more and more of their distinctive vegetable features, while the series of animal forms part with more and more of their distinctive animal characters, and the two series converge to a common term. . . . The most characteristic morphological peculiarity of the animal is the absence of any such cellulose investment (of the cells as plants possess). The most characteristic physiological peculiarity of the animal is its want of power to manufacture protein out of simpler compounds. *Huxley, Anat. Invert.*, pp. 43-47.

Suspended animation, a temporary cessation of animation; especially, asphyxia. = *Syn.* (a) Life, existence, vitality. (b) *Animation, Life, Liveliness, Vivacity, Spirit, Sprightliness, Gaiety, buoyancy, cheerfulness, energy, ardor.* The first four words indicate, by derivation, a full possession of the faculties of life; therefore they are the opposite of deadness or of any semblance of lifelessness. The same idea appears in the next two under the notion of the possession of the breath of life. *Animation* applies broadly to manner, looks, and language: as, *animation* of countenance; he spoke with *animation*; it implies, perhaps, more warmth of feeling than the others. *Life* is not expressive of feeling, but of full vital force and any form of its manifestation: as, his words were instinct with *life*; his delivery lacked *life*. *Liveliness* is primarily suggestive of the energetic exercise of the powers of life in alertness of mind, freshness of interest, etc. *Vivacity* applies especially to conversation, but is used also of manner and looks; it belongs mostly to externals. *Spirit* is variously compounded of courage, vigor, firmness, enthusiasm, and zeal, according to the connection; it implies the best qualities of the manly man in action. *Sprightliness* is vivacity with mirth or gaiety; it is lighter than *spirit*. *Gaiety* is the overflow of animal spirits in talk and laughter promoted by social intercourse, festivity, dancing, etc. See *mirth, hilarity, gladness, happiness*.

Pg. anime* (NL. *anime, animi, also anjman*), applied in the middle of the 16th century, and prob. earlier, to a gum brought from the East by the Portuguese; afterward applied to a similar product from the West Indies. The word, which has not been found native in the East or elsewhere, is said by Ray and others to be a Portuguese corruption of *aminata*, *Gr. ἀμινά* (Dioscorides), a resinous gum, this name being appar. an adj. (see *σπίρμα*, myrrh), referring to a people of Arabia bordering on the Red Sea, from whom the gum was obtained. *Elemi* is a different word.] 1. animism (an'i-mizm), *n.* [= *F. animisme*; *< L. anima*, soul (see *anima*), + *-ism*.] 1. The hypothesis, original with Pythagoras and Plato, of a force (*anima mundi*, or soul of the world) immaterial but inseparable from matter, and giving to matter its form and movements.—2. The theory of vital action and of disease propounded by the German chemist G. E. Stahl (1660-1734); the theory that the soul (*anima*) is the vital principle, the source of both the normal and the abnormal phenomena of life. In Stahl's theory the soul is regarded as the principle of life, and in its normal action, of health; the body being supposed to be incapable of self-movement, and not only originally formed by the soul, but also set in motion and governed by it. Hence it was inferred that the source of disease is in some hindrance to the full and free activity of the soul, and that medical treatment should be confined to an attempt to remove such hindrances from it.

3. The general conception of or the belief in souls and other spiritual beings; the explanation of all the phenomena in nature not due to obvious material causes by attributing them to spiritual agency. Among the beliefs most characteristic of animism is that of a human apparitional soul, that is, of a vital and animating principle residing in the body, but distinct from it, bearing its form and appearance, but wanting its material and solid substance. At an early stage in the development of philosophy and religion events are frequently ascribed to agencies analogous to human souls, or to the spirits of the deceased.

Spiritual philosophy has influenced every province of human thought; and the history of *animism* once clearly traced, would record the development, not of religion only, but of philosophy, science, and literature.

Encyc. Brit., II. 57.

The theory of *Animism* divides into two great dogmas, forming parts of one consistent doctrine; first, concerning souls: individual creatures, capable of continued existence after the death or destruction of the body; second, concerning other spirits, upward to the rank of powerful deities.

—*Syn.* 2. Animosity, Ill-will, Enmity, Malice, Hostility, Hatred, Hate, Malediction, Malignity, Rancor, Grudge, Spite. These words differ from those described under *acrimony*, *anger*, and *antipathy* (which see) in that they represent deeper feelings or more permanent passions. *Ill-will* may represent the minimum of feeling, being a willing or wishing of ill to another, generally without disposition to be active in bringing the evil about. *Enmity* is a somewhat stronger feeling, and it often gratifies itself in trifling and cowardly ways. *Animosity* is more intense than *enmity*; it is avowed and active, and what it does is more serious than the covert attacks of *enmity* or the hasty attacks of *spite*. *Malice* is pure badness of heart, delighting in harm to others for its own sake. *Hostility* is less passionate than *animosity*, but not less avowed or active, being a state of mind inclining one to aggressive warfare. *Hatred* and *hate* are the general words to cover all these feelings; they may also be ultimate, expressing the concentration of the whole nature in an intense ill-will. *Malediction* is more casual and temporary than *malice*, arising upon occasion furnished, and characterized by a wish that evil may befall another rather than by an intention to injure. *Malignity* is malice intensified; it is hatred in its aspect of destructiveness or desire to strike at the most vital interests of another. *Rancor* is hatred or malice turned sour or bitter; it is implacable in its vindictiveness. A *grudge* is a feeling of sullen ill-will or enmity, caused by a trifling wrong, and likely to be appeased when it has spent itself in a similar return against the offender. *Spite* is sudden, resentful, and generally quite as well pleased to mortify as to damage another; it may be as strong as malice or as weak as pique.

ally. All glassware, china, etc., which is to be subjected to great changes of temperature should be thus treated. The working of iron and steel by hammering, bending, rolling, drawing, etc., tends to harden them and make them brittle, and the original properties are restored by annealing. Steel plates and dies for bank-note printing and the like are annealed in a close box with iron filings or turnings, lime, or other substances, and are thus freed from carbon and reduced to pure soft iron, in which state they will readily take, under pressure, the finest engraving from a hardened plate or die. They are then hardened again to the degree necessary for their use in printing. Steel for engraving dies is commonly annealed by heating it to a bright cherry-red color, and cooling it gradually in a bed of charcoal.

(with single *l* after *F. annelés*, pp. pl., ringed), prop. *Annel-lida*, < *L. annellus*, more correctly *anelus*, dim. of *anulus*, a ring (see *annulus*), + *-ida*.] **1.** The annelids or *Annelides*, a class of invertebrate animals, of the phylum *Vermes*, sometimes called the class of red-blooded worms. The body is composed of numerous (up to some 400) segments, somites, or metameres, and limbs are wanting, or, if present, are rudimentary and consist of the cilia or setae known as parapodia. A vascular system with red blood is usually present; the integument is soft, and composed of many layers, the surface being mostly ciliate or setose; the head is wanting or rudimentary, and in the latter case consists of a prostomium which may be cirriferous or tentaculiferous. The *Annelida* are the "worms," properly so called, of which the common earthworm, lobworm, and leech are characteristic examples. Most of the species are aquatic and marine. The class is differently limited by different authors, the principal variation among later writers, however, being in excluding or including the *Gephyrea*. Excluding these, as is done by the above definition, the *Annelida* have been divided into four orders: (1) *Hirudinea, Discophora*, or *Suctorioria*, the leeches; (2) *Oligochaeta, Abranchia, Terricolæ*, etc., the earthworms and their immediate allies; (3) *Chaetopoda, Polychæta, Errantia*, etc., the free sea-worms; and (4) *Cephalo-branchia, Tubicolæ*, etc., the tubicolous sea-worms. Another scheme divides *Annelida* into four subclasses: (1) *Archannelida*, composed of the genus *Polygordius* and its allies; (2) *Chaetopoda*, including (2), (3), and (4) of the foregoing schedule; (3) *Hirudinea* or *Discophora*; and (4) *Entero-pneusta*, consisting of the genus *Balanoglossus*, which some authorities class with the ascidians or *Chordata*.

2. In Huxley's system (1877), a superordinal division including the *Polychæta, Oligochaeta, Hirudinea*, and *Gephyrea*, with the *Myzostomata* doubtfully added thereto: a group the members of which resemble one another generally in the segmentation of the body indicated at least by the serially multiganglionate nervous centers (wanting in most *Gephyrea*), in the

presence of cilia and segmental organs, and in the nature of the larvæ, which are set free when the embryos hatch.

Meanwhile, if we are ready to think of freedom as absolute and perfect in man—a perfect freedom from the necessity of any *antecedens*—we ought logically to think of it as free from all influences of God or Devil, as Will, that is, in which the Omnipresent is not present and the Omnipotent has no power. *Mandeville*, *Body and Will*, p. 7.

2. In *astron.*, an apparent motion of a planet from east to west, or contrary to the order of the signs of the zodiac. = *Syn.* 1. *Precedence*, etc. See *priority*.

antecedency (an-tē-sē'den-si), *n.* The quality or condition of being antecedent.

—3. In *logic*: (a) That member of a conditional proposition of the form, "If A is, then B is," which states, as a hypothesis, the condition of the truth of what is expressed in the other member, termed the *consequent*: in the proposition given the antecedent is "if A is." The whole proposition amounts to the statement that all possible cases of the truth of the antecedent are included among the possible cases of the truth of the consequent. (b) The premise of a consequence, or syllogism in the first figure with the major premise suppressed. Thus, the argument, "A syllogism has never existed *in sensu*, therefore it does not exist *in intellectu*," is a consequence, its premise is the *antecedent*, and its conclusion the *consequent*. (c) An event upon which another event follows. So used particularly by nominalists. An *invariable antecedent*, with J. S. Mill, is an event upon which another follows according to an invariable rule or uniformity of nature. It does not, therefore, mean (as might be supposed) an event of a kind which antecedes every occurrence of another kind of event. Thus, lightning is not an invariable antecedent of thunder, for thunder does not always follow it; and this although lightning antecedes thunder whenever thunder is heard.

2. In advance of any observation of the effects of a given hypothesis; on *a priori* grounds.

We are clearly proceeding on the assumption that there is some fixed relation of cause and effect, in virtue of which the means we adopt may be *antecedently* expected to bring about the end we are in pursuit of.

The *post-nati*, or those born after the accession, claimed the rights of natives of England. In the United States the term is applied to those born in the colonies prior to the Declaration of Independence.

One of the lateral articulated appendages occurring in pairs on that segment of the head of an arthropod animal, as an insect, which immediately precedes the mouth or mandibular segment; a feeler or 'horn.' They vary greatly in size, shape, and function. The appendages of the head, proceeding forward from the mouth-parts, are: (1) antennæ, (2) antennule, (3) ophthalmites or eye-stalks. (4) *pl.* In *Crustacea*: (1) Properly, the posterior one of the two pairs of feelers or horns borne upon the head of most crustaceans, as crabs and lobsters, as distinguished from the anterior pair, or antennule. From their relative size they are known as the long feelers, in distinction from the antennule, or short feelers. When fully developed the antennule consist of a number of parts, which, beginning with the base, are named the *basicerite*, the *scaphocerite*, the *ischio-cerite*, the *merocerite*, the *carpocerite*, and the (terminal) *procerite*. The last may consist of a long filament with many articulations, sometimes exceeding the whole length of the animal's body. See cuts under *Cypris*, *Cytheroidea*, and *Limulus*. (2) Loosely, either one of the two pairs of horns or feelers, that is, either the antennæ proper or the antennule. (3) In *Arachnida*, or spiders, scorpions, etc., a chelicere; one of the pair of chelate or subchelate appendages of the head, situated between the mouth-parts and morphologically in front of the large hooked or pincer-

like appendages known as pedipalps. They are adapted for seizing and tearing, and sometimes convey a poison-diet. They are homologous with the feelers of crustaceans and insects, and are supposed in some cases at least to represent antennule as well as antennæ proper. See cuts under *Cheliceræ* and *Scorpion*. (4) In *Insecta* and *Mollusca*, a horn or feeler, one of the pair of jointed flexible sensitive appendages of the head, morphologically situated between the mouth-parts and the eyes, though generally appearing in the adult between or before the eyes. These characteristic organs are usually filamentous with many articulations, and are very diverse in form; some of the terms used in describing their shapes are filiform, digitiform, bipinnate, clavate, geniculate. In *Coleoptera*, divisions have been founded upon the shapes of the antennæ, as lamellicorn, clavicorn, longicorn, etc. These organs are almost universally present in some form or other, though occasionally rudimentary and inconspicuous, in which cases the insects are termed *acornis*, as distinguished from *decornis*. The parts of a well-formed antenna usually recognized are the pedicel, scape, and flagellum or clavella, the last usually composing most of the length of the organ. See *Hemiptera*, *Insecta*.

2. An analogous organ on the heads of other animals, as a feeler or tentacle, like the eye-stalk of a snail.—3. *pl.* Projecting horns of iron or bronze found on some ancient helmets, perhaps serving only as ornaments, or as badges, or in some cases to stop a blow from glancing downward and striking the shoulder.—**Decussate, deflexed, deformed, etc., antennæ.** See the adjectives.

The pectoral members are distinctly geniculate or provided with an elbow-like joint. They are chiefly inhabitants of tropical seas, and the typical species are often called *frog* or *toad-fishes*.

Antennariinæ (an-tē'nā'ri-ī-nē), *n. pl.* [NL., < *Antennarius + -inæ*.] A subfamily of pediculate fishes, of the family *Antennariidæ*, with the head compressed, a rostral spine or tentacle as well as two other robust spines, and a well-developed soft dorsal fin. Four genera are known, the chief of which is *Antennarius*. The typical species are mostly found in coral-groves, where they lurk partially concealed, but one of the best known, *Pterophryne histrio*, inhabits the sargassum-weed of the open seas, and makes in it a nest for its young.

[Rare.]

It is to be considered, that whatsoever virtue is in numbers for conducting to consent of notes, is rather to be ascribed to the *antennumber* than to the entire number: as namely, that the sound returneth after six or after twelve (i. e., tones or semitones); but that the sixth or the thirtieth is not the matter, but the sixth or the twelfth; and the seventh and thirteenth are but the limits and boundaries of the return. *Barrow, Sylva Sylvarum*, § 106.

These antepredicaments are seven, viz., three definitions, two divisions, and two rules. The definitions are of equivocal, univocal, and denominative. The divisions are of things set into terms and propositions and the eight modes of inference. The rules are the *dictum de omni* and *dictum de aliquo* and that which affirms that the difference of different genera are different. Anthropology thus includes physiology, psychology, sociology, ethnology, etc., putting under contribution all sciences which have man for their object. By some it has been divided into: (a) *zoological anthropology*, which investigates man's relations to the brute creation; (b) *descriptive anthropology*, or *ethnology*, which describes the divisions and groups of mankind; (c) *general anthropology*, or, as M. Broca calls it, "the biology of the human race." The ascription of human attributes to supernatural or divine beings; in *theol.*, the conception or representation of God with human qualities and affections, or in a human shape. Anthropomorphism is founded in man's inability to conceive beings above himself otherwise than in his own likeness. It determines the growth and form of all human religions, from the lowest up to the highest: as where the Scriptures speak of the eye, the ear, and the hand of God, of his seeing and hearing, of his remembering and forgetting, of his making man in his own image, etc.

Although Milton was undoubtedly a high Arian in his mature life, he does, in the necessity of poetry, give a greater objectivity to the Father and the Son than he would have justified in argument. He was wise in adopting the strong anthropomorphism of the Hebrew Scriptures at once.
Cotteridge, *Table-Talk*, p. 293.

2. The conception of animals, plants, or nature in general, by analogy with man: commonly implying an unscientific use of such analogy.

Descartes . . . deserted the old moderate view which affirmed that between the highest psychical powers of man and brute there is a certain natural likeness and analogy, and gave rise to the notion that animals are nothing but wonderfully complex machines -- an error naturally resulting in the opposite one now so prevalent -- the error, namely, that there is a substantial identity between the brute soul and the soul of man -- biological anthropomorphism.

[*L., etc., anti-, < Gr. ἀντι-, prefix, αντί, prep., over against, opposite to, against, opposed to, answering to, counter, equal to, = Skt. anti, over against, = L. ante, in comp. ante-, rarely anti-, before, = Goth. OS. AS., etc., and-: see further under ante- and -and.* In a few words *anti-* represents *L. ante, anti-*, as in *anticipate, antibrachial*.] A prefix of Greek origin: originally only in compounds or derivatives taken from the Greek or formed of Greek elements, as in *antipathy, antinomy*, etc. (the earliest example in English being *antichrist*, which see), but now a familiar English formative, meaning primarily against, opposed to. It forms—(1) Compound nouns (with the accent on the prefix), in which *anti-* has the attributive force of opposed to, opponent, opposite, counter, as in *antichrist, antipope, antichorus, anticyclone, antipole*, etc. (2) Compound adjectives (with the accent on the radical element), in which *anti-* retains its original prepositional force, against, opposed to, governing the noun expressed or implied, as in *antichristian, antipapal, antilevelled*, etc. Such compound adjectives adopt an objective termination, as in the examples just cited, or omit it, as in *antichurch, antisalvage, antiprobation, antirent*, when it does not exist or is not readily formed. This mixture of adjective and substantive forms makes easy the development, from the compound adjectives, of abstract nouns like *antisalvage, antiprobation*, etc. In form these compound adjectives, like *antichristian, antilevelled, anti-Socialist*, are thus, strictly, made up of *anti* with a noun and an adjective termination, as *anti- + Christ + -ian, anti- + clerical + -al, anti- + Social + -ism*, etc.; but in effect they are often equivalent to, and for brevity they may be marked as, *anti- + Christian, anti- + clerical*, etc. These compounds are especially applied to persons or parties opposed in opinion or practice to other persons or parties, or to things; in medicine, to remedies producing or intended to produce an effect or condition opposite to or in correction or prevention of that implied in the simple word, as *antiscorbutic, antipyretic, antifat*, etc. In the etymologies following, *anti-* is treated as a mere English formative, and is not referred to the Greek, except when obviously taken, in connection with the radical element, directly from the Greek.

The Antiburghers denied that this oath could be taken consistently with the principles of the church, while the Burghers affirmed its compatibility. The result was that the church was rent in two, each section establishing a communion of its own, known respectively as the General Associate Synod, or Antiburghers, and the Associate Synod, or Burghers. They were reunited in 1820, after seventy-three years of separation, thus constituting the United Secession Church.

1 John ii. 18, 22.

The word occurs in the Scriptures only in the Epistles of John; but the same person or power is elsewhere referred to (2 Thes. ii. 1-12; 1 Tim. iv. 1-3; 2 Pet. ii. 1). Interpretations of Scripture differ in their understanding of these references. Some suppose them to relate to a lawless but impersonal power, a spirit opposed to Christianity; some to a historic personage or potentate, as Caligula, Titus, the pope, or Luther; some to a great power for evil yet to be

manifested and gathered about a central personal agency. Roman Catholic writers commonly interpret the word generally of any adversary of Christ and of the authority of the church, but specifically as the last and greatest persecutor of the Christian church at the end of the world. The name has also been applied to the pretenders to the messiahship, or false Christs (Mat. xxiv. 24), who have arisen at various periods, as being antichristian to the true Christ. Of these as many as sixty-four have been reckoned, including some of little importance, and also some, as Mohammed, who cannot properly be classed among them.

4. In logic, the term used since Cicero (Latin anticipatio) to translate the "prolepsis" (προλήψις) of the Epicureans and Stoics. It denotes any general notion considered as resulting from the action of memory upon experiences more or less similar. Such a notion is called an anticipation because, once possessed, it is called upon its entirety by a mere suggestion. It thus acquaints us with what has not yet been perceived, by a reference to past perceptions. Hence, with later philosophers, the word denotes knowledge drawn from the mind, independently of experience; the knowledge of axioms or first principles. With Bacon an anticipation of nature is a hasty generalization or hypothesis: opposed to an interpretation of nature. In Kant's philosophy, anticipation is the a priori knowledge that every sensation must have degrees of intensive quantity.

Antelope (an-ti-lō'pē), *n.* [*NL.; see antelope.*]

1. A genus of *Antilopinae* (which see). The term has been used with such latitude in its application to the whole of the group *Antilopinae*, and, when restricted, has been employed in so many different senses, that it has lost whatever exact meaning it may have possessed originally, and has become a loose, fluctuating synonym of the subfamily name *Antilopinae*. Even in early usage it appears to have been applied to several different small gazel-like antelopes. It is now commonly restricted to the sasin or Indian antelope, *Antelope cervicapra*. See cut under *sasin*. *2t* (an-ti-lōp). [*l. c.*] Obsolete (English) spelling of *antelope*.

Antilopidæ (an-ti-lōp'i-dē), *n. pl.* [*NL., < Antelope + -idæ.*] A family of ruminants; the antelopes; sometimes used as a synonym of *Antilopinae*. Also written *Antilopidae*.

Antilopinae (an-ti-lō-pi'nē), *n. pl.* [*NL., < Antelope + -inæ.*] A subfamily of old-world and chiefly African ruminants, the antelopes, a group belonging to the family *Bovidae*. They differ from cattle in their smaller size, more lithe and graceful form, slenderer legs, which are comparatively longer in the shank, and longer neck, with slenderer vertebrae, splitting the head. The *Antilopinae* shade directly into the sheep and goats (*Ovis* and *Capra*), being separable from them by no technical character; but the horns usually differ from the forms presented by goats and sheep, though they are so diverse as to be definable by no common character. *Antilopinae* are especially numerous in species and individuals in Africa, of which continent they are the most characteristic animals. Upward of 50 African species have been described; there are many others in Asia, and a few in Europe. Some 75 species are recognized by naturalists, but probably the number of genuine species is less than this. Several hundred different names, generic, specific, and vernacular, have been applied to these animals; and no authors except mere compilers are agreed upon the division of the group. The antelopes present the utmost diversity of stature, form, and general appearance, ranging from the smallest and most delicate gazels, steinboks, and springboks to the bulky eland, nyghau, or hartbeest, as large as a cow, horse, or stag, and include the singularly misshapen gnu (*Connochaetus gnu*). The Rocky Mountain goat, *Haplocerus montanus*, related to the Alpine chamois, *Rupicapra traumas*, and the goral, *Nemochilus goral*, another goat like antelope, are also placed in this subfamily. The bubaline or bovine antelopes include the hartbeest (*Aelaphus caama*), blesbok (*A. albi-frons*), and bontebok (*A. pumilus*). Four-horned antelopes belong to the genus *Tetracerus*. The philantomba and coqueton antelopes, the blawhek, duyker, etc., are placed in the genus *Cephalophus*. The steinboks are species of *Neotragus*; the singing, kobus, leche, bohor, etc., are of the genera *Cervicapra*, *Kobus*, and their immediate allies. The gazels are a large group, constituting the genus *Gazella* (or *Dorcus*), and others; they include the springbok (*Antilocapra eulone*), and are Indian, Arabian, and Syrian, as well as African. The sable or quinine antelopes constitute the genus *Hippotragus*. The addax is *Addax nasomaculatus*. There are several species of *Oryx*, as *O. leucogaur*. The nyghau is *Boselaphus traumas*. The harnessed antelopes (so-called from the stripes on the sides), or the boshboks, are species of *Trachypus*, as *T. scriptus*, *T. subcinctus*. The koodoo is a large antelope with twisted horns (*Strepsiceros kudu*). The eland is *Gnus gnus*. The so-called saiga antelope is the type of a different family, *Saigidae* (which see); the American antelope also belongs to a different family, *Antilocapridæ* (which see). See cuts under *addax*, *eland*, *gazel*, *gnu*, and *Haplocerus*. Also written *Antelopinae*.

S. hist.*, a political party which originated in New York State about 1827, in the excitement caused by the supposed murder of William Morgan, of Batavia, New York, in 1826 by freemasons, to prevent a threatened public disclosure of the secrets of their order. The movement spread to some other States, and a national party was organized, but within about ten years it disappeared, most of the Antimasons becoming Whigs. Its chief distrust point was that freemasons ought to be excluded from public office, because they would necessarily regard their obligations to the society more than their obligations to the state. Its principles were revived in a so-called American party organized in 1875.

Ch.*, a consecrated cloth on which the eucharist is consecrated in places where there is no consecrated altar. It takes the place of the portable altar of the Latin Church. The form is sometimes extended in the Syrian churches to a thin slab of wood or even of gold for a like purpose. Also written *antimonia*.

antimere (an'ti-mē-rē), *n.* [**< Gr. ávri, against, + μέρος, a part.**] In *bot.*, a segment or division of the body in the direction of one of the secondary or transverse axes, all of which are at right angles to the primary or longitudinal axis.

When these axes are not differentiated in any way, all antimeres are alike and are parts arranged around the long prime axis like the spokes and felloes of a wheel around the axis of the hub, a disposition preserved with much accuracy in many of the *Radula*, among which, for example, the arms of a starfish, the tentacles of a sea-anemone or coral animalcule, or the rows of ambulacra of a sea urchin are antimeres. Other, however, the transverse axes are differentiated, some being shorter, others longer, giving rise to sides, as right and left, in the direction of the longer transverse axes, in which case right and left parts are antimeres. This constitutes bilateral symmetry. Parts which may be perceived to correspond at opposite poles of the other (shorter) transverse axes, constituting dorsolateral symmetry, are also antimeres; but this condition is obscure. Likewise, again, parts along the primary longitudinal axis, or at its poles, which may be observed or be conceived to constitute anteroposterior symmetry, are essentially antimeric; but this condition, like disabdominal symmetry, is obscure, while the serial succession of like parts along the prime axis, as the rings of a worm, crustacean, or insect, and the double rings of a vertebrate, is so marked that antimeres of this kind are not called antimeres, but *metameres*; such are the ordinary segments, somites, antimeres, or diathermies of any articulate or vertebrate animal. Antimere is therefore practically restricted to such radiating and bilateral parts as are more or less symmetrical with one another. *See antipoloid.*

G. antimonium = Russ. antimoniya = Pol. antymonium, etc., < ML. antimonium, antimony, a word of unknown origin, simulating a Gr. appearance, perhaps a perversion, through such simulation (*antimonium*, < **atimonium*, < **atimidium*, < **athimidium*?), of the Ar. name (with art. al-) *ethmad, othmod, ithmid*, earlier *ithmid*, antimony, which is in turn perhaps an accommodation (through **isthimmid*) of the Gr. στυμνός, one of the stems of στυμνός, στυμνός, στυμνός), also στυμνός and στυμνός (**στιμνός*), > L. *stinni, stibi*, and *stibium*, antimony, the Gr. name itself being appar. of foreign or Eastern origin: see *stibium*. False etymologies formerly current are: (1) < F. *antimoine*, < Gr. ávri, against, + μόνη, a monk, as if 'monk's bane'; (2) < Gr. ávri, against, + μόνος, alone, as if never found alone; (3) < Gr. ávri, instead of + L. *minium*, red lead, "because women used it instead of red lead" as an eye-paint.] Chemical symbol, Sb (Latin *stibium*); atomic weight, 120. A metal of a white color and bright luster which does not readily tarnish, having a specific gravity of 6.7, crystallizing in the rhombohedral system, and in the mass ordinarily showing a crystalline structure and highly perfect cleavage. It conducts both heat and electricity with some readiness, but less perfectly than the true metals, and differs from them also in being brittle like arsenic. It melts at 450° C. (856° F.), and volatilizes slowly at a red heat, when melted in the air it oxidizes readily, forming antimony trioxid, Sb_2O_3 . Antimony occurs uncombined in nature to a limited extent, usually in granular or foliated masses, often with a botryoidal or reniform surface. Many compounds of antimony are found in nature, the most important of them being the sulphid, Sb_2S_3 , called gray antimony, antimony glance, or stibnite. Dyscrasite is a compound of antimony and silver. There are also a number of minerals containing antimony, sulphur, and lead (like jamesonite), or antimony, sulphur, and silver (like pyrazurite or ruby silver), or antimony, sulphur, and copper (like tetrahedrite). The oxysulphid kermesite or red antimony and the oxysulphide and stibnite (antimony ochre) are also important minerals. Antimony has few uses in the arts; it enters, however, into a number of very valuable alloys, as type-metal, pewter, Britannia metal, and Babbitt metal, and is used in medicine. Tartar emetic is the tartar of antimony and potassium. James's powder is a mixture of oxid of antimony and phosphate of lime. **Antimony vermilion**, a sulphid of antimony suggested but never used as a pigment. **Argentine flowers of antimony**, the tetroxid of antimony. **Arsenical antimony**. *See allomontite*. **Black antimony**, antimonous sulphid. **Butter of antimony**. *See butter¹.*—**Ceruse of antimony**. *See ceruse*. **Diaphoretic antimony**, a preparation chiefly consisting of potassium antimonate, made by exposing the neutral antimonate to the action of carbonic acid gas, or by dehydrating pure antimony with potassium nitrate. Same as *kermesite*. **White antimony**, or antimony white, native antimony trioxid, Sb_2O_3 . **Yellow antimony**, or antimony yellow, a preparation of the oxys of lead and antimony, of a deep-yellow color, used in enamel and porcelain painting. II. n. In *theol.*, one who maintains that Christians are freed from the moral law as set forth in the Old Testament by the new dispensation of grace as set forth in the gospel; an opponent of legalism in morals. Antinomianism has existed in three forms: in the early church, as a species of Gnosticism, in the doctrine that sin is an incident of the body, and that a regenerate soul cannot sin; later, in the Reformation, as a reaction against the doctrine of good works in the Roman Catholic Church, in the antinomistic doctrine that man is saved by faith alone, regardless of his obedience to or disobedience of the moral law as a rule of life; finally, as a phase of extreme Calvinism, in English Puritan theology, in the doctrine that the sins of the elect are so transferred to Christ that they become his transgressions and cease to be the transgressions of the actual sinner. The chief exponent of the second form of antinomianism was John Agricola (Germany, 1492-1566); the chief exponent of the third, Tobias Crisp, D. D. (England, 1600-1642). [Often with a capital.]

= *Syn. Hatred, Dislike, Antipathy, Disput, Aversion, Reluctance, Repugnance.* Hatred is the deepest and most

permanent of these feelings; it is rarely used except of persons. *Dislike* is the most general word, and depends upon the connection for its strength; it is opposed to *like* or *friendship*. *Antipathy* expresses most of constitutional feeling and least of volition; the turkey cock has an *antipathy* to the color red; many people have an intense *antipathy* to snakes, rats, toads. In figurative use, *antipathy* is a dislike that seems constitutional toward persons, things, conduct, etc.; hence it involves a dislike for which sometimes no good reason can be given. *Antipathy* is opposed primarily to *sympathy*, but often to *sympathy*. *Dislike* is the feeling of physical taste, then of esthetic taste, then of spiritual taste or mental feeling. *Aversion* is a fixed disposition to avoid something which displeases, disturbs, or annoys; as, quiet people have an *aversion* to noise. It is a dislike settled and generally strong. *Reluctance* and *repugnance* by derivation imply a natural struggle, as of hesitation or recoil; with *reluctance* it is simply the will holding back in dislike of some proposed act, while with *repugnance* it is a greater resistance or one accompanied with greater feeling, and generally in regard to an act, course, idea, etc., rarely to persons or things. See *animosity*.

"antocularis* (see *ramus*), the branch or tine of a stag's horn before the eye, *< L. ante, before, + oculus, eye: see ante- and ocular, and cf. antocular.*] 1. (Originally, the first tine or branch of the horns of a deer.—2. Any of the principal tines or branches of a deer's horns: with a descriptive prefix or epithet. (See below.)—3. Now, when used absolutely, one of the solid deciduous horns of the *Cervidae*, or deer family, which are periodically shed and renewed, as distinguished from the permanent hollow horns of other ruminants. Antlers are of all shapes and sizes, from the short simple spikes of some species to the enormous branched or palmate antlers of the stag, elk, or moose. They are secondary sexual organs developed in connection with the rut, and generally only in the male sex; in some *Cervidae*, as reindeer, in both sexes. They consist of a modification of true bone, and are therefore radically different from the cuticular or epidermal structures (chitons) of other ruminants. During growth they are covered with a modified periosteal and epidermal tissue, abounding in blood-vessels, and furry outside; this is

Stag's Antler in successive years.

a, brow-antler; *b*, boss-antler; *c*, antler royal; *d*, semi-royal, or crown-antler.

the velvet, affording a copious supply of blood to the rapidly enlarging osseous tissue. When the antlers are full-grown the vascular activity of the velvet ceases, a result mechanically facilitated by the development of the boss or bur at the root of the beam, which to some extent strangulates the blood-vessels. The velvet then withers and shrivels, and peels off in slabs, or is rubbed off by the animal. The horns of the American prongbuck are antlers, inasmuch as they are deciduous and grow in the manner just described; but they are cuticular structures, and otherwise like the horns of cattle. In foresty, the tines of much-branched antlers, as those of the stag, have special names. In the first year the stag has only frontal protuberances, called *bosses*; in the second, a simple stem of *stags* called *spike* in the case of American deer, in the third, a longer stem with one branch, the *brow-antler*, in the fourth, the *boss*, *boss*, or *bun* antler; in the fifth, the *antler royal* is acquired; after which the ends of the stag's horns become more or less palmate, developing the *crown* or *semi-crown*, whence more or fewer points diverge in subsequent years. The total number of 'points,' counting all the tines, may be ten. The main stem of a branched antler is the *beam*; the branches, exclusive of the more points of the palmated part, are the *tines*. The order of branching is different in different species; in some the division is dichotomous throughout, as in the male-deer of America. In general, the tines are offsets of a main beam. The reindeer is remarkable for the great size of the brow-antler, which is also usually much larger on one side than on the other. The most palmate antlers are those of the European elk and of the American moose.

preparing a kind of pitfall for the destruction of insects (chiefly ants). It digs a tunnel-shaped hole in the driest and finest sand it can find, working inside the hole and throwing up the particles of sand with its head. When the pit is deep enough, and the sides are quite smooth and sloping, the ant-lion buries itself at the bottom with only its formidable mandibles projecting, and waits for its prey. aorta a-ō'-rī), *n.*; pl. *aorta* (-ē-). [NL., < Gr. *αἰσθητή*, *aorta*, < *αἰσθη*, raise, lift, pass, *αἰσθητή*, rise. Cf. *artery*.] In *anat.*, the main trunk of the arterial system, issuing from the left ventricle of the heart, conveying arterialized blood to all parts of the body except the lungs, and

giving rise, directly or indirectly, to all the arteries of the body except the pulmonary. The name is usually given to such artery in those higher vertebrates which have a completely four-chambered heart. The aorta commonly gives off immediately the great vessels of the head, neck, and anterior limbs, and ends by forking to supply the posterior limbs. In the embryo it communicates with the pulmonary artery by a duct (ductus arteriosus), which is normally closed at birth. In man the aorta is divided into *ascending*, *transverse*, and *descending* portions. The *ascending* aorta rises and then curves over to the left, forming the *transverse* portion or *arch* of the aorta, whence spring the innominate and left carotid and left subclavian arteries; it then descends upon and a little to the left of the bodies of the vertebrae, forming the *descending* aorta, divided into the *thoracic* aorta above the diaphragm and the *abdominal* aorta below it; it ends usually opposite the fourth lumbar vertebra by bifurcating into the right and left common iliac arteries. The thoracic branches are numerous, but small and chiefly into costal; the abdominal branches are the coeliac, superior and inferior mesenteric, renal, suprarenal, spermatic, and others. The aorta is provided at its beginning with three semilunar valves, which prevent regurgitation of blood into the heart. See *aortic*, and *ends under circulation, embryo, heart, thorax*. — **Cardiac aorta**. See *extract below*. — **Definitive aorta**, the aorta as defined above. — **Primitive aorta**, the first and paired main arteries of the embryo, connected with the omphalomesenteric vessels. See *extract*.

The heart of the vertebrate embryo is at first a simple tube, the anterior end of which passes into a cardiac aortic trunk, while the posterior end is continuous with the great veins which bring back blood from the umbilical vesicle. The *cardiac aorta* immediately divides into two branches, each of which ascends, in the first visceral arch, in the form of a forwardly convex aortic arch, to the under side of the rudimentary spinal column, and then runs parallel with its fellow to the hinder part of the body as a *primitive subvertebral aorta*. The two *primitive aorta* soon coalesce, in the greater part of their length, into one trunk, the definitive subvertebral aorta, but the aortic arches, separated by the alimentary tract, remain distinct.

Huxley, Anat. Vert., p. 90.

aortal (ā-ō'-tal), *a.* [*< aorta + -al.*] Same as *aortic*. [Rare.]

aortic (ā-ō'-tik), *a.* [*< aorta + -ic.*] Belonging or pertaining to the aorta. — **Aortic arch**. (a) The permanent arch of the aorta. See *aorta*. (b) One of the five or more pairs of arterial arches of the embryo of a vertebrate, formed by forkings of the primitive cardiac aorta, and uniting to form the primitive and finally the definitive subvertebral aorta, or aorta proper. There is a pair of such aortic arches to each pair of visceral arches of the neck. In the higher vertebrates the two anterior pairs disappear; the third pair is modified into the carotid arteries supplying the head; the fourth pair becomes the arteries supplying the anterior limbs and the permanent arch of the aorta. — In man, the innominate and right subclavian on the right side, and the left subclavian and arch of the aorta on the left; in the fifth pair in man the right side is obliterated, and the left forms the permanent pulmonary artery, the descending aorta, and the ductus arteriosus, which is the communication between the fifth and the fourth arches. In branchiate vertebrates most of these arches are permanent, becoming the blood vessels of the gills.

Aortic bulb, the enlargement at the beginning of the cardiac aorta. — **Aortic compressor**, in *surg.*, an instrument, used in cases of amputation at the hip-joint, for compressing the aorta, in order to limit the flow of blood from it to the divided femoral artery. — **Aortic orifice**, aortic aperture, of the diaphragm, the hole of the diaphragm, between its right and left pillars, through which the aorta passes from the thorax into the abdomen; it also gives transit to the thoracic duct, and usually to an azygos vein. — **Aortic valves**, the three semilunar valves at the origin of the aorta from the left ventricle of the heart, guarding the orifice and preventing regurgitation into the ventricle. **Aortic vestibule**, the part of the left ventricle adjoining the root of the aorta.

= *Syn.* Indifference, Insensibility, Impassibility, Apathy, Stoicism, Unconsciousness, Phlegm, Calmness, Torpor, Coldness, Coolness, Unfeelingness, Lethargy, Inanimability. (See list under *indifference*.) *Indifference* denotes absence of feeling, passion, or desire toward a particular object; as, *indifference* to pain or ridicule. *Apathy* commonly implies a general want of feeling, a complete indifference in regard to anything, due to want of interest or attention, as in the case of a depressed or sluggish intellect, or of extreme illness or affliction. *Insensibility* and *impassibility* suggest the lack of capacity for feeling, or an absence of susceptibility, being qualities rather than states of mind. *Indifference* arising from *impassibility* relates more particularly to internal, that arising from *insensibility* to external impressions; the former is, moreover, more profound and radical than the latter. *Indifference* may be an entirely proper state under the circumstances; *insensibility* and *impassibility* are always at least to be pitied; *unconsciousness* is always and *indifference* some times blameworthy, as cold and selfish. *Stoicism* is a studied suppression of feeling, or the concealment especially of painful feeling by force of will. *Unconsciousness* is absence of volition. (See *unconscious*.) *Phlegm* is most suggestive of physical temperament; it is a constitutional dullness or sluggishness, an incapacity of being aroused by anything. *Calumnies* is a tranquility resulting from the mastery of the will over passions and feelings that perhaps are strong and keen, and hence is always commendable.

With the instinct of long habit he turned and faced the battery of eyes with the same cold *indifference* with which he had for years encountered the half-hidden sneers of man.

Still less respectable appears this extreme concern for those of our own blood which goes along with the *unconsciousness* for those of other blood, when we observe its methods.

The *aphorism* . . . formulated by Linnaeus in regard to plants. *Quatrefores, Human Species* (trans.), p. 50.

2. A precept or rule expressed in few words; a detached sentence containing some important truth: as, the *aphorisms* of Hippocrates, or of the civil law.

The three ancient commentators on Hippocrates . . . have given the same definition of an *aphorism*, i. e., "a succinct saying, comprehending a complete statement," or a saying poor in expression, but rich in sentiment. *Fleming*.

= *Syn. Aphorism, Axiom, Maxim, Precept, Dictum, Apothegm, Saying, Adage, Proverb, Truism, Byword, Saw*, all concur in expressing a pithy general proposition, usually in one short sentence; but the longer the form the less applicable do these names become. An *aphorism* is a truth, pointedly set forth, relating rather to speculative principles, ethics, or science than to practical matters, and forming a brief and excellent statement of a doctrine: thus, "Moderation is the silken string running through the pearl-chain of all virtues," and "Maladies are cured by nature, not by remedies," are *aphorisms*. "Life is short, and art is long," is from the first *aphorism* of Hippocrates. An *axiom* is a self-evident truth, and is therefore used as a basis for reasoning. "A straight line is the shortest distance between two points" is one of the *axioms* of mathematics. "The greater good is to be chosen before the less" is an *axiom* of morals. The number of *axioms* is necessarily limited; of *aphorisms*, *maxims*, etc., unlimited. A *maxim* is a truth which, while not so definite and necessarily true as an *axiom*, yet equally acceptable to the mind, refers rather to practical than to abstract truth, stating one of the fundamental rules of conduct, civil government, business policy, and the like: as, it is a sound *maxim* that one should risk in speculation no more than he can afford to lose. It suggests a lesson more pointedly and directly than *aphorism*, and differs from *precept* in that a *precept* is a direct injunction, whereas a *maxim* is a mere statement of a truth from which a *precept* may be deduced. It would be a *precept* to say, "In speculation risk no more than you can afford to lose." A *dictum* is not a *precept*, but an opinion given with authority, as from superior knowledge: as, a *dictum* of the critics; a *dictum* of Carlyle's. An *apothegm*, in common matters what an *aphorism* is in higher, is essentially a terse proposition that makes a vivid impression on the mind: thus, "In the adversity of our best friends we always find something that doth not displease us," this is called by Dean Swift a *apothegm*, but is more properly an *apothegm*. "Heaven helps those that help themselves," and

"He who fights and runs away
May live to fight another day"

(Goldsmith, *Art of Poetry*),

are *apothegms*. As *apothegm* is a lower grade of *apothegm*; each is likely to be found associated with the name of the author: as, the *apothegms* of Socrates; a *maxim* of Poor Richard. Each is a felicitous expression current for its own sake, but deriving additional popularity from the celebrity of its author. "Herein is that *maxim* true, One soweth and another reapeth," John iv. 37; "The little and short sayings of wise and excellent men are of great value, like the dust of gold or the least sparks of the diamond," *Tilghson*. *Adage* and *proverb* are habitual sayings, generally of long standing, embodying the common sense of mankind on ordinary subjects. The *adage* is often the more venerable by age and the more dignified in its character: as, "Necessity knows no law." A *saying* may easily become an *adage*. *Proverb* as used in the Bible is often a *saying*: as, "Physician, heal thyself," Luke iv. 23; but in the mod-

ern sense *proverb* often appears in some concrete figurative and homely form: as, "Too many cooks spoil the broth"; "Every tub must stand on its own bottom." A *truism* is a truth too obvious to need explanation or proof; it is a word of relative application; what would be a *truism* to one might be an *axiom* or an *aphorism* to another. A *byword* is a cant term or phrase, in every one's mouth like a proverb, but applied in disparagement. *Saw* is a contemptuous term for an expression that is more common than wise, or for a trite or foolish saying reiterated to wearisomeness.

Depilatory Sea-hare *Aplysia depilans*.

Its numerous species are remarkable for the function of secreting a fluid of violet color (due to the presence of iodine), which they discharge when molested. One of the best known is *A. depilans*, the depilatory sea-hare, so called because it was supposed that the fluid it discharged was capable of removing hair or preventing its growth. Specifically, it denotes the inhibition of respiration by the presence of an abnormally great quantity of oxygen in the blood. It is also improperly used by some to denote the opposite condition, that of *asphyxia*.

apochromatic (ap'ô-krô-mat'ik), *a.* [*< Gr. ἀπο*, from, + *χρῶμα* (-τ-), color, + *-ic*.] An epithet descriptive of an improved form of lens devised by Professor Abbe of Jena, constructed of new kinds of glass which allow of a more perfect correction of chromatic and spherical aberration than has hitherto been possible. The kinds of glass employed are chiefly remarkable in that their dispersion for different parts of the spectrum is nearly proportional; hence a lens constructed of them is not subject to the limitation of an ordinary achromatic lens of being strictly achromatic for two colors only. Another defect of ordinary lenses, that their spherical aberration is not corrected for all rays, is also largely overcome.

The elimination of these errors realizes an achromatism of higher order than has hitherto been attained. The objectives of this system may be therefore distinguished from achromatic lenses in the old sense of the word by the term *apochromatism*, and may be called *apochromatic objectives*. *Jour. Roy. Microsc. Soc.*, Feb., 1887, p. 23.

Specifically—2. *Eccl.*: (*a*) A name given in the early church to various writings of uncertain origin and authority, regarded by some as inspired, but rejected by most authorities or believers. Such books were, that works acknowledged to be useful and edifying, but not established as canonical, or else heretical writings, clandestinely copied by the church. (*b*) [*comp.*] A collection of fourteen books subjoined to the canonical books of the Old Testament in the authorized version of the Bible, as originally issued, but now generally omitted. They do not exist in the Hebrew Bible, but are found with others of the same character, scattered through the Septuagint and Vulgate versions of the Old Testament. They are: First and Second Esdras, the two Third and Fourth Esdras, the Book of Esther, the Book of Judith, the Wisdom of Solomon, the Book of Baruch, the Book of Tobit, the Book of Daniel, the Book of the Three Children, the History of Susanna, the History of Bel and the Dragon, the Prayer of Manasses, and the Prayer of Manasses. Most of these are of a later date than the Roman Catholic Church as fully accepted, though it is held that they have often distinguished them as apocryphal, on the ground that their place in the canon was decided rather than that of the other books. In the name Apocrypha, the two (last) books of Esdras, and the Prayer of Manasses, and other writings in the above collection, namely, Third and Fourth Esdras, a book of Daniel, and others, and of 15th Psalm of David, and eighteen Psalms of Solomon. With these sometimes are included certain pseudepi-

graphic books, such as the Apocalypse of Baruch and the Assumption of Moses. The name Apocrypha is also occasionally made to embrace the Antilegomena of the New Testament. The Greek Church makes no distinction among the books contained in the Septuagint. In the Anglican and Lutheran churches, the Apocrypha are read for exhortation and instruction of manners, but not for the establishing of any doctrine. See *antilegomena* and *deutero-canonical*.

Apocynaceæ (a-pos-i-nā'sē-ō), *n. pl.* [*N.L.*, < *Apocynum* + -aceæ.] A natural order of dicotyledonous plants, having for its type the genus *Apocynum*, or dogbane. It is very nearly allied to the order *Asclepiadaceæ*, from which, however, it is distinguished by the fact that its stamens are free from the style and stigma, and its anthers contain granular pollen. The species are largely tropical, and have a milky juice that is often acrid and sometimes very poisonous. India-rubber is obtained from several species in Africa, India, and South America. The order furnishes woods that are used for carving and furniture, several fiber-plants, barks valuable in medicine, and some edible fruits. It includes the orchid-tree of Madagascar (*Cerbera mangostina*), the milk-tree of Demerara, the cream-fruit of Sierra Leone, and the periwinkle (*Vinca*), oleander (*Nerium oleander*), Cape jasmine (*Rhaphanispermum*), and plants of the genus *Albomaria* which are cultivated in gardens and greenhouses.

(*c*) In *Ichth.*, same as *Apodes*. (*d*) In Linnaeus's system of classification, the second order of echinoderms, contrasted with *Poda*. (*e*) With Van der Hoeven, an order of echinoderms. See *Gephyrea*. (*f*) In Claus's arrangement, an order of holo-

thurians, containing the families *Synaptidae* and *Molpadidae*, the last of which constitutes his suborder *Pneumophora*. (*g*) In Macleay's system of classification, a division of *Amphibia*, including those which have no feet or distinct head, opposed to *Polypoda*. It is divided into three groups, the *Lambricoida*, *Neurothia*, and *Harvudinia*, or the earthworms, invertebrates, and leeches. (*h*) An order of *Amphibia*, same as *Gymnophiona* or *Ophiomorpha*, constituted by the family *Ceciliidae* alone. (*i*) A group of degraded parasitic crustaceans, having a vermiform body, a suctorial mouth, no thoracic or abdominal limbs (and consequently no *trilob.*) and a rudimentary peduncle represented by two separate threads bearing the characteristic antenniform organs. There is but one genus, *Proteodius* (which see).

Apodes (ap'ō-dēz), *n. pl.* [*N.L.*, masc. pl. of *apud* (apod-): see *apod*.] 1. An order of fishes to which very different limits have been assigned. (*a*) In the classification of Linnaeus (1758), a group of osseous fishes without ventral fins and comprising a heterogeneous assemblage of representatives of various modern orders. (*b*) In Bloch and Schneider's system (1801), some one of several orders of fishes, the name being repeated under several so-called classes which were distinguished by the number of fins. As thus used, the word was a descriptive rather than a distinctive term. (*c*) In Cuvier's system, a section of the malacopterygians, the name being applied adjectively to such forms as are destitute of ventral fins. The true eels, synbranchiate eels, *Gymnionot*, typical *Ophidioides*, and *Anmodytoidea* were referred to this group. (*d*) By various later writers the name was used as a distinctive ordinal name. By T. Muller the *Ophidioides* and *Anmodytoidea* were eliminated. By Gill, in 1861, the order was restricted to the typical and synbranchiate eels, and later (1884) to the true eels, or teleost fishes with the intermaxillaries atrophied or lost, the supermaxillaries lateral, and the body anguilliform and destitute of ventral fins. These characters are correlated with various others which justify the isolation. The principal families are the *Anguillidae*, *Ophichthidae*, and *Muraenidae*.

2. In De Blainville's system of classification, a division of his *Entomozoaria*; the apodal, as distinguished from the chaetopod, entomozoans. It includes the leeches, and is approximately equivalent to the *Hendemia* of modern naturalists, but contains many intestinal worms.

The argumentation is from a similitude, therefore not *apodictic*, or of evident demonstration.

Dr. J. Robinson, *Eudoxa* (1658), p. 23.

There is one character which will be considered decisive, and that is the *apodictic* certainty belonging to mathematical conclusions.

G. H. Lewes, *Probs. of Life and Mind*, I. i. § 202.

2. In *logic*, a term descriptive of a form of judgment in which the connection of subject and predicate is asserted to be necessary; asserting its own necessity. Thus, "Two spheres

whose centers are distant from each other by less than the sum of their radii must intersect" would be an *apodictic* judgment. Such judgments may be false. This use of the word appears to have originated with Kant.

II. n. The logical doctrine of demonstration and of science.

Apodictic, we may assume, is in like manner the formal study of what constitutes knowledge strictly so called, the nature of the principles on which knowledge rests, the special marks distinguishing it, and the method by which knowledge is framed.

R. Adamson, *Encyc. Brit.*, XIV. 785.

apodictical, apodeictical (ap-ō-dik'ti-kal, -dik'ti-kal), *a.* Same as *apodictic, apodeictic*.

apodictically, apodeictically (ap-ō-dik'ti-kal-i, -dik'ti-kal-i), *adv.* 1. Demonstratively; so as to be evident beyond contradiction.

Kant's marvellous acuteness did not prevent his transcendental from being *apodictically* resolved into absolute idealism. Sir W. Hamilton.

Apodictically, we should say, if α is the cause of β , then all α which possesses α possesses β ; thus reasoning from cause to causatum. R. Adamson, *Encyc. Brit.*, XIV. 789.

2. By, or in the manner of, an apodictic judgment. See *apodictic*, 2.

apodon (ap'ō-don), *n.* An improper form of *apodion*.

apodosis (a-pod'ō-sis), *n.* [L., < Gr. *ἀπόδοσις*, a giving back, return, answering clause, < *ἀποδοῖναι*, give back, < *ἀπό*, from, away, + *δοῖναι*, give, = L. *dare*, give. Cf. *dose*.] 1. In *gram.*, the concluding part of a conditional sentence; the consequent which results from or is dependent on the protasis, or condition; the conclusion. Thus, in the sentence, If it rains, I shall not go, the first clause is the *protasis*, the second the *apodosis*. When the *protasis* is introduced by such conditional conjunctions as *notwithstanding*, *though*, *although*, the *apodosis* predicates something opposite to what might have been looked for: as, Although we were few in numbers (*protasis*), we overthrew the enemy (*apodosis*). By some grammarians the term is not restricted to conditional sentences, but is extended to others similarly constructed: thus, in a simile the *apodosis* is the application or latter part.

That point in the orbit of a planet or other heavenly body which is at the greatest distance from the earth; especially, that particular point of the moon's orbit. The ancients regarded the earth as fixed in the center of the universe, and accordingly assigned to the sun, with the planets, an apogee; but now that the sun is recognized as the center of our system, the terms *perihelion* and *aphelion* are employed to denote the least and greatest distance of the planets from that orb. Strictly, then, now, the sun is in its apogee when the earth is in its aphelion. In the Ptolemaic astronomy, the mean apogee of the epicycle is the point of the epicycle furthest from the center of the equant; the true apogee of the epicycle is that point of it furthest from the earth; and the fixed apogee of the epicycle is that point of it furthest from the center of the eccentric.

II. *n.* One of a religious sect deriving their name from Apollinaris the Younger, bishop of Laodicea, in the fourth century. Apollinaris denied the proper humanity of Christ, attributing to him a human body and a human soul, or vital principle, but teaching that the Divine Reason, or Logos, took him the place which in man is occupied by the rational principle. Later the sect maintained that even the body of Christ was of one substance with his divinity, that he was incarnate from eternity, and that his divinity suffered on the cross. After breaking up into different sects, the Apollinarians were finally merged in the Monophysites. Also called *Apollinist*.

In *Gr.* and later in *Rom. myth.*, one of the great Olympian gods, the son of Zeus (Jupiter) and Leto (Latona), representing the light- and life-giving influence, as well as the deadly power, of the sun, and often identified with the sun-god, Helios. He was the leader of the Muses, god of music, poetry, and healing, and patron of these arts; a mighty protector from evil, all seeing, and hence the master of prophecy; also the destroyer of the unjust and insolent, and ruler of pestilence. In art he was represented in the full manhood of youthful manhood, in most of his attributions unclothed or but lightly draped, and usually characterized by the bow and arrows, the laurel, the lyre, the oracular tripod, the serpent, or the dol-

phian. He was the father of Esculapius, to whom he granted his art of healing. Apollo was honored, both locally and generally, under many special titles, of which each had its particular type in art and literature: as,

APOLLO.

=Syn. 2. *Apology, Excuse, Plea.* *Apology* has in this sense the force of an admission that one has been, at least seemingly, in the wrong; it therefore pleads any extenuating circumstances, or, more often, offers a frank acknowledgment as the best that can be done toward making matters right. *Excuse* may mean a defense, or an explanation simply: as, his *excuse* was quite sufficient: or it may be a mere attempt at justification: as, it was only an *excuse*; or it may be a begging to be released from a claim: as, "they all with one consent began to make *excuse*," Luke xiv. 18. A *plea* consists, according to the occasion, of an appeal for leniency, or of justificatory or exculpatory argument or persuasion.

Our English Martyrologer counted it a sufficient *apology* for what meanness might be found in the first edition of his "*Acts and Monuments*," that it was "hastily rashed up in about fourteen months."

The name was given to these structures when they were supposed to be expansions of nerves, any hard whitish tissue being then considered nervous. In present usage *aponeurosis* is nearly synonymous with *fascia*, but is often applied to the fascia-like tendons of muscles: as, the *aponeurosis* of the oblique muscle of the abdomen.

It was founded in the Jesuit house of studies at Valo, diocese of Le Puy, in France, in 1844, and was approved by Pope Pius IX. in 1866, and again finally by Leo XIII. in 1879. It numbers many millions of associates of every condition of life throughout the world.

See *apostolic see*.—**Apostolic Constitutions**, a collection of diffuse instructions, relating to the duties of clergy and laity, to ecclesiastical discipline, and to ceremonies, divided into eight books. Unlike the apostolic canons, they seem to have been practically unknown in the West until their publication in the sixteenth century, though existing in ancient MSS. in some libraries; like the canons, they profess to be the words of the apostles, written down by Clement of Rome. Controversy has existed with regard to their precise age, composition, and authoritative character. They are now generally supposed to be considerably later than the time of the apostles, but to have been in existence, in the main, by the end of the third and the beginning of the fourth century.—**Apostolic council**. Apotomes are of six incommensurable classes. To define these, let α denote the length of the minimal line, called by Euclid the whole, and let π denote the length of the subtracted line, called by Euclid the adapted line (προσ-αποστέμνεται). The apotome is $\alpha - \pi$. It is a *first apotome* if α and π are commensurable with the unit line. It is a *fifth apotome* if $\pi^2 - \pi^2$ is incommensurable but π commensurable with the unit line. It is a *sixth apotome* if neither $\alpha^2 - \pi^2$, α nor π is commensurable with unity. The *first apotome of a medial line* is the difference of two medial lines, commensurable in power only, whose rectangle is a rational area. In the former case a fresh apportionment is made by Congress every ten years, shortly after the completion of the decennial census returns, and in the latter generally after stated enumerations made at different dates in different States, or after the federal census. In the federal apportionment, Congress determines the proportion of representatives to population (one to 173,901 of the total population of the United States under the census of 1840, or 350 in all), and the State legislatures fix the boundaries of the elective districts accordingly. Thus, "Cicero, the famous *orator*, lived in the first century before Christ"; "On him, their second *Providence*, they hung." In languages that distinguish cases, the noun in apposition is in the same case as the word to which it is apposed. The same term is also used of an adjective that stands to the noun (or pronoun) to which it refers in a less close relation than the proper attributive, being added rather parenthetically, or by way of substitute for a qualifying clause. Thus, "They sang Darius, *great and good*"; "Truth, *crushed to earth*, shall rise again." Rarely, it is applied to a clause, whether substantive or adjective, that qualifies a noun (or pronoun) in an equivalent manner. Compare *attributive* and *predicative*. = **Syn.** *Value, Price, Esteem, Estimate, Appreciate.* *Value* and *estimate* commonly imply a comparison with a standard of commercial worth; as, to *value* a picture at so much; to *estimate* its value at so much. To *price* is to value highly, generally for other than pecuniary reasons, and suggesting the notion of reluctance to lose. Thus, we *price* a book for its contents or associations; we *price* a friend for his affection for us. To *esteem* is sometimes simply to think; as, I *esteem* him a scoundrel; sometimes to value; as, I *esteem* him lightly; sometimes to have a high opinion of or set a high value on; as, I *esteem* him for his own sake; in its highest sense it implies moral approbation. *Estimating* is an act of computation or judgment, and wholly without feeling or moral approbation; as, to *estimate* the size of a room, the weight of a stone, the literary excellence of a book, the character of a person. (See *esteem, n.* for comparison of corresponding nouns.) *Appreciate* is to set a just value on; it implies the use of wise judgment or delicate perception; as, he *appreciated* the quality of the work. With this perception naturally goes a corresponding intellectual valuation and moral esteem; as, they knew how to *appreciate* his worth. *Appreciate* often implies also that the thing appreciated is likely to be overlooked or underestimated. It is commonly used of good things; as, I *understood* his wickedness; I *realized* or *recognized* his folly; I *appreciated* his virtue or wisdom. Compare such phrases as an *appreciative* audience, a few *appreciative* words, *appreciation* of merit.

a priori (ā pri-ō'ri). [*L., from something prior or going before: a for ab, from; priori, abl. of prior, neut. prius, preceding: see prior, a.*] From the former; from that which precedes; hence, from antecedent to consequent, from condition to conditioned, or from cause to effect. Since the fourteenth century, the phrase *demonstratio a priori* (first found in Albert of Saxony, died 1380) has been commonly employed, instead of the earlier expression *demonstratio propter quid*, to mean proof proceeding from causes or first principles: opposed to *demonstratio a posteriori*, or *demonstratio quia*, which proceeds from effect to cause, and simply proves the fact without showing why it must be as it is. In the eighteenth century *demonstratio a priori* was applied to reasoning from a given notion to the conditions which such notion involves. But since Kant, *a priori*, used as an adjective and frequently placed before the noun, has been applied to cognitions which, though they may come to us in experience, have their origin in the nature of the mind, and are independent of experience.

Demonstration is perfect, when it proceedeth from the proper cause to the effect, called of the scholmen, *a priore*. Blunderb., *Arte de Logica* (1599), vi. 19.

Thus when we argue from the ideas we have of immensity, eternity, necessary existence, and the like, that such perfections can reside but in one being, and thence conclude that there can be but one supreme God, . . . this is an argument *a priori*. Clarke.

General truths, which at the same time bear the character of an inward necessity, must be independent of experience—clear and certain by themselves. They are therefore called *a priori*, while that which is simply taken from experience is said to be, in ordinary parlance, known *a posteriori* or empirically only.

Kant, *Critique of Pure Reason*, tr. by Max Muller.

As used in a psychological sense, knowledge *a posteriori* is a synonym for knowledge empirical, or from experience; and, consequently, is adventitious to the mind, as subsequent to, and in consequence of, the exercise of its faculties of observation. Knowledge *a priori*, on the contrary, called likewise native, pure, or transcendental knowledge, embraces those principles which, as the condition of the exercise of its faculties of observation and thought, are, consequently, not the result of that exercise. True it is that, chronologically considered, our *a priori* is not antecedent to our *a posteriori* knowledge; for the internal conditions of experience can only operate when an object of experience has been presented. Sir W. Hamilton.

sanctuary of any church, particularly if it presents a superficial resemblance to an apse in the stricter sense, in that it is at least approximately semicircular in plan, and vaulted: commonly equivalent to *chevet*, and applied to the altar extremity of a church, even if of rectangular plan and not vaulted, and including the apse-aisles, chapels, and any other adjunct to the ritual east end of a church. The apse in its origin was a characteristic feature of the ancient Roman basilica, in which it formed the raised tribune for the court magistrates. The throne of the quæstor or presiding judge stood in the center of the chancel of the apse. When the basilicas became Christian churches, the throne was replaced by the high altar, which still occupies this position in Latin churches of the strict basilica type, and has regularly kept it in Oriental churches. Some types of church regularly have secondary apses in other positions than at the eastern end, as at the western end, at the extremities of the transepts or of aisles, etc. See cuts under *basilica* and *bréma*. Also *apsis*.

(b) An apse-chapel. **Apsidal surface**, in *math.*, a surface related to many other surfaces and to any point as Fresnel's wave surface is related to the quadric surface and to its center, that is to say, on each plane section of an original surface through a certain fixed point the radii from that point which cut the section orthogonally are taken, and distances equal to these radii are measured off from the fixed point on the perpendicular to the section; then the locus of the extremities of these lines so measured is the apsidal surface.

=*Syn.* 1. *Apt*, *Fit*. "The words *apt* and *fit* might be thought to differ only in this, that the former is of Latin derivation; but *apt* has an active sense, and *fit* a passive sense—a distinction clearly shown by Shakespeare, when the poisoner in the play in Hamlet says, 'hands *apt*, drugs *fit*,' and by Wordsworth: 'Our hearts more *apt* to sympathize with heaven, our souls more *fit* for future glory.'" *H. Reed*, Eng. Lit., p. 106.—2. Meet, fitting, germane, appropriate.—3 and 4. *Apt*, *Likely*, *Liable*, *Subject*, prone.

Apt, when used in this sense of persons, indicates physical tendency or inward inclination: as, *apt* to catch cold; *apt* to neglect work; when used of things, it similarly indicates natural tendency: as, *apt* to mold. *Likely* may suggest the same idea: as, he is *likely* to do it; it is *likely* to rust; or it may express mere external probability or chance: as, he is *likely* to come at any moment. *Liable* in this connection is properly used only of exposure to evil, being practically equivalent to exposed, or exposed to the danger of: as, *liable* to accident; *liable* to be hurt, that is, exposed to the danger of being hurt; *liable* to censure: in such use it does not express probability or tendency, but merely the possibility of exposure or risk. *Subject* expresses what is likely to happen to a person or thing, and occasionally does so convey different ideas. The things to which we are *liable* are determined more by accident or circumstance: the things to which we are *subject* are determined by nature and constitution. *Apt* to be suddenly ill; *liable*, but not *likely*, to die before the physician arrives; *subject* to attacks of epilepsy.

How *apt* the poor are to be proud!

A conduit or channel for conducting water from one place to another. More particularly applied to structures of masonry and tunneling for the conducting of water from distant sources to large cities through tubular conduits. Aqueducts were extensively used in the Roman empire, and many of these ancient structures still remain. They were constructed of stone or wood, sometimes tunneled through hills and carried over valleys and rivers on arches, much of the labor upon them being uselessly expended, from a mistaken idea of the necessity of a perfectly level course. The aqueduct of Segovia originally built by the Romans, has 159 arches, is in some parts built in two tiers 100 feet or more in height, and is an admirable monument of ancient engineering. One of the most remarkable aqueducts of modern times is that of Marseilles, to which city it conveys the waters of the river Durance from a distance of about 65 miles, of which 10 miles consists of tunnels, and a considerable portion is traversed by numerous vaults of great height and length. This aqueduct was built between 1839 and 1847 and supplies water in such abundance that the environs of Marseilles, formerly

II. n. 1. A kind of ornament of a capricious and fanciful character, consisting of lines, geometrical figures, fruits, flowers, foliage, etc., variously combined and grouped, and painted, inlaid, or wrought in low relief: used especially for the decoration of walls and ceilings, but also for the decoration of objects of any nature. In the arabesque or the Mohammedan annual forms were readily excluded, in accordance with the requirements of their religious law; but the Greeks and Romans, and the Renaissance artists, among them Raphael and his scholars, to whom are due the rich arabesque decorations of the loggia of the Vatican, laid all the kingdoms of nature under contribution. The Greeks undoubtedly derived the idea of pictorial or plastic ornament of this kind from the Oriental stucco, painted, woven, or embroidered with natural or fabulous forms of plants and animals, which were brought to them by Phœnician traders from a very early period.

II. n. 1. A native of Arabia; an Arab. — **2.** One of a Christian sect of the third century (commonly called *Arabici*) which sprang up in Perea, beyond the Jordan, a region often included in Arabia. According to Eusebius, its members "asserted that the human soul, as long as the present state of the world existed, perished with the body, but that it would be raised again with the body at the time of the resurrection." The point was discussed with them by Origen, at a council with much force that they were led to change their opinions.

styles of architecture, but applied especially to Egyptian and Oriental examples. This architecture shows in its systems of construction and ornament the profound influence of Persian and Byzantine models, though, as a rule, in architectural science it falls far behind the work of the Byzantine masters. The ovoid-domed dome supported on pendentives is a characteristic feature; the buildings are usually square or polygonal in plan, seldom circular; the roofs are in general flat, and supported by arches resting on columns forming long parallel aisles, and often surrounding a central court. The arches are very commonly of the horseshoe shape developed in Persia, and from the beginning show the pointed form, though it is clear that neither form was adopted for constructive reasons, and that neither influenced the methods of building, much less revolutionized the entire art of architecture, as did the adoption of the pointed arch in western Europe. Walls, particularly interior walls, ceilings, domes, spandrels, etc., are commonly covered with an intricate lace-work of arabesques, usually executed in relief on stucco, and often colored with at once great brilliancy and great delicacy. The most noteworthy examples of the style exist in Cairo — *Arabic figures* or characters, the numeral characters 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, so called as having been introduced into European from Arabic. They were so introduced in the twelfth century, and the work of Leonardo of Pisa, published in 1202, contributed much to their dissemination. They were taken from the Arabic work of Al-Khowarazmi (see *algorism*), who obtained them in India or Afghanistan. The system in its complete form (with the cipher) certainly originated in India; but what the ultimate origin of the characters was, whether they had been previously known in Europe without the cipher, and their history among the Arabians, are matters still in dispute.

II. n. The language of the Arabians; a Semitic dialect, belonging (along with the Himyaritic and Abyssinian languages) to the southern branch of the Semitic family, and generally regarded as exhibiting more ancient features than any other Semitic tongue. It is the language of the Koran, the sacred language of Islam, and possesses an immense literature, almost wholly Moslem and later than the time of Mohammed. Many other languages have borrowed largely of its material, from the Persian, Turkish, Hindustani, and Malay on the east to the Spanish on the west.

Araceæ (a-rā'sē-ē), *n. pl.* [*NL.*, < *Arum + -aceæ*.] A natural order of monocotyledonous plants, of which the genus *Arum* is the type.

The species are herbaceous perennials, mostly acaulescent from tuberous or creeping roots, but in the tropics often tall rooting climbers. The inconspicuous flowers, usually monocious or dioecious, are crowded upon a spadix surrounded by a spathe, with which it is sometimes confluent. The order includes 98 genera and about 1,000 species, abundant within the tropics, but comparatively rare in temperate regions. The larger genera are *Arum*, *Philodendron*, *Philodendron*, *Arisaema*, and *Pothos*. In temperate North America there are 10 species, belonging to 8 genera, of which the most common is the Jack-in-the-pulpit, or Indian turnip, *Arisaema triphyllum*. The skunk cabbage, *Symplocarpus foetidus*, and the sweet flag, *Acorus calamus*, are also well known representatives of the order. The tuberous roots of many species abound in starch, and furnish a wholesome food when cooked, or after the acidity has been removed by washing, as in the taro, *Colocasia antiquorum*, which is extensively cultivated in tropical countries. British or Portland arrowroot is manufactured from the roots of *Arum maculatum* (the wake robin or cuckoo-pint), the species of which are natives chiefly of tropical countries. A principle of acidity generally pervades the *Araceæ*, existing in so strong a degree in some as to render them dangerous poisons, as *Dioscorea* *scutellaria* of the West Indies and South America, which receives its popular name *dumb-bell* from the fact that when it is chewed the tongue becomes swelled by the acid juices, and the power of speech is destroyed. Many species are cultivated in greenhouses, chiefly as foliage plants, and

The genus is remarkable in the order for its elongated pedicel-like calyx-tube, and for the manner in which the growing stipe of the ovary bends downward and, attaining a length of 2 or 3 inches, pushes the ovary into the ground, where it begins to enlarge and ripen. The best-known species is *A. hypogaea*, the common peanut or groundnut, which is now cultivated in most warm climates, and is esteemed a valuable article of food. Its pod when mature is oblong, often contracted in the middle, wrinkled, of a pale-yellow color, and contains two seeds of the size of a hazel-nut, sweet in flavor, especially when

(*c*) A class of the phylum *Arthropoda*, including the spiders, scorpions, false scorpions, harvestmen, and mites, with or without the bear-animalcules and the *Pneumonia* and *Pentastomida*. They are apterous, ametabolous, articulate animals, with articulated legs. They are decephalized by the blending of the head with the thorax as a cephalothorax, normally bearing 8 legs, and never more; the antennae are transformed into chela when present; the abdomen is usually distinct but not segmented, or if segmented is not distinctly separated from the cephalothorax, and does not bear limbs, the appendages being in the higher forms transformed into spinnerets; the eyes are simple and generally more than two in number; the respiratory apparatus is pulmonary or tracheal, or compounded of these two forms; and their mode of progression is digitigrade. There are about 4,500 species, some of which are fossils occurring in the Silurian and Carboniferous. They are now divided into from six to nine orders. Huxley makes six: *Arthropogastera*, *Arachnina*, *Arachnina*, *Arachnina*, *Pneumonia*, *Pentastomida*. Parnoy makes nine: *Scorpiones*, *Cheliferidae*, *Acaridae*, *Arachnidae*, *Phalangidae*, *Phrynidae*, *Arachnidae*, *Arachnidae*, *Pentastomida* (without *Pneumonia*). The glands have been divided into five kinds: acutrim, ampullate, aggregate, tubuliform and tubular. Their ducts enter the arachnidial mammillae, and discharge through orifices in the arachnidial papilla.

What was formerly called the cavity of the arachnoid is now termed the subdural space. The arachnoid is by some regarded as simply the outermost layer of the pia mater. The bow was made of steel, horn, or other material, and was of such great strength and stiffness that some mechanical appliance was used to bend it and adjust the string to the notch. The lighter arbalists, used in the chase, and generally by horsemen, required a double hook, which the arbalister carried at his girdle. Heavier ones required a kind of lever, or a windlass, or a revolving winch with a ratchet and long handle, to draw them: these appliances were separate from the arbalist, and were carried slung from the shoulder or at the belt. The short and heavy arrow of the arbalist was called a *quarrel*, from its square head, or more commonly a *bolt*, as distinguished from the *shaft* discharged by the longbow. Sometimes stones (see *stone-bow*) and leaden balls were used. The missile of the arbalist was discharged with such force as to penetrate ordinary armor, and the weapon was considered so deadly as to be prohibited by a council of the church except in warfare against infidels. It could, however, be discharged only twice a minute. It was used especially in the attack and defense of fortified places. arch¹ (ärch), *n.* [*< ME. arch, arca, < OF. arca (> ML. archæa), mod. F. arche, an arch, fem. form (prob. by confusion with OF. and F. arche, ark, < L. arca; see arch*²) of OF. and F. arc, < L. arcus: see *arch*.] 1. In *geom.*, any part of the circumference of a circle or other curve; an arc. See *arc*, 1.—2. In *arch.*, a structure built of separate and inelastic blocks, assembled on a curved line in such a way as to retain their position when the structure is supported extraneously only at its two extremities. The separate blocks which compose the arch are called *voussoirs* or *intrados*. The extreme or lowest *voussoirs* are termed *springs*, and the uppermost or central one, when a single stone occupies this position, is called the *keystone*. The under or concave face of the

arch is called the *intrados*, and the upper or convex face the *extrados*. The arch is said to be *extradosed*. The supports which afford resting and resisting points to the arch are *piers* or *abutments*, which resist its lateral thrust, and which are properly portions of the wall or other structure above the springing and abutment of the shoulder of the arch. The upper part of the pier upon which the arch rests (technically, the point from which it springs) is the *impost*. The *span* of an arch is the distance between its opposite imposts. The *rise* of an arch is the height of the highest point of its intrados above the line of the imposts; this point is sometimes called the *under side* of the *crown*. The *thrust* of an arch is the pressure which it exerts outward. This pressure is practically collected, so far as it is manifested as an active force, at a point which cannot be exactly determined theoretically, but is at about one third of the height of the rise of the arch. The thrust must be counteracted by abutments or buttresses. Arches are designated in two ways: First, in a general manner, according to their properties, their uses, their position in a building, or their exclusive employment in a particular style of architecture. Thus,

the Roman emperors, and were originally temporary structures, festooned and otherwise decorated, standing at the entrance of a city, or in a street, that a victorious general and his army might pass under them in triumph. At a later period the triumphal arch became a richly sculptured, massive, and permanent structure, having an archway passing through it, and often a smaller arch on either side. The name is at the present day often given to an arch, generally of wood decorated with flowers, evergreens, banners, etc., erected on the occasion of some public celebration or rejoicing. The great arch in a church which gives access to the choir, the chancel arch, is sometimes so called. In early Christian churches, a representation of the Glory or Triumph of Christ sometimes occupied a wall-space above this arch.

siliferous stratified formations. This series is still called by some writers *archæan*, because thus far it has not been found to contain any traces of life. It also includes an undetermined portion of the rocks formerly designated as *primæval*, and by some writers is vaguely used to indicate crystalline rocks of uncertain and often quite recent age. See *archæozoic* and *primæval*.

Archæology is sometimes taken specifically in the restricted sense of the science of ancient art, including architecture, sculpture, painting, ceramics, and decoration, together with whatever records may accompany and serve to identify them.—**Classical archæology**, the archæology of ancient Greece and Rome.—**Medieval archæology**, the archæology of the middle ages.—**Syn. Archæology, Antiquarianism.** Antiquarianism deals with relics of the past rather as objects of mere curiosity or as interesting merely on account of their antiquity: *archæology* studies them as means to a scientific knowledge of the past. See *palæontology*.

It is of Jurassic age, and is notable as the oldest known avian type, and

as combining some characters of a lizard with those of a bird. The original fossil consisted only of the impression of a single feather, upon which the name *Archæopteryx*

lithographica was imposed by Von Meyer. A second specimen from the same formation and locality was named *A. maenensis* by Owen. The specific identity of the two can be neither affirmed nor denied, and their generic identity is only presumptive. A third and still more characteristic specimen is identical with the second, and has furnished many additional characters. Members of this genus had teeth, a long, lizard-like tail formed of many vertebrae, and separate metacarpal bones, in combination with a catinate sternum and other features of modern birds. It is thus a unique type of ornithic structure, and represents a distinct subclass of *Aves*. See *Saurura*.

archæostoma (är'kê-os'tô-mä), *n.*; *pl. archæostomata* (är'kê-ô-stô-ma-tä). [NL., < Gr. ἀρχαῖος, ancient, + στόμα, mouth.] In *biol.*, a primitive blastopore; a primitive unmodified enteric orifice, both oral and anal: opposed to *deuterostoma*. Also written *archæostome*.

archæostomatous (är'kê-ô-stô-ma-tus), *a.* [NL. *archæostomatus*, < Gr. ἀρχαῖος, ancient, + στόμα(-), mouth.] 1. Pertaining to or having the characters of the *Archæostomata*.—2. In *biol.*, having a primitive blastopore or original orifice of invagination of a blastosphere which has undergone gastrulation; retaining an archenteric aperture, as distinguished from any other which may be acquired by a deuterostomatous gastrula: it is the usual state of those gastrulae which are formed by emboly.

In the former [process of gastrulation by emboly] the blastopore would be left as the aperture of communication of the endoderm with the exterior; and the result would be the formation of an *archæostomatous* gastrula.

archæus (är-kê'us), *n.*; *pl. archæi* (-i). [NL., < Gr. ἀρχαῖος, ancient, primitive, < ἀρχ-, beginning, < ἀρχ-, be first: see *archæo-*.] In the philosophy of Paracelsus and other spagyrics, mystics, and theosophists, a spirit, or invisible man or animal of ethereal substance, the counterpart of the visible body, within which it resides and to which it imparts life, strength, and the power of assimilating food. The word is said to have been used by Basil Valentine, a German chemist of the fifteenth century, to denote the solar heat as the source of the life of plants. Paracelsus uses it with the above meaning. It is frequent in the writings of Van Helmont, who explains it as a material preexistence of the human or animal form *in posse*. He regards the archæus as a fluid, that is, as a semi-material substance, like air, and seems to consider it a chemical constituent of the blood. Paracelsus had particularly made use of the hypothesis of the archæus to explain the assimilation of food. This function of the archæus became prominent in medicine. Van Helmont calls it the door-keeper of the stomach (*janitor stomachi*). There are further divarications of meaning. Also spelled *archæus*.

As for the many pretended intricacies in the instance of the efformation of Wasps out of the Carcase of a Horse, I say, the *Archei* that formed them are no parts of the

Horse's Soul that is dead, but several distinct *Archei* that do as naturally join with the Matter of his body, so putrefied and prepared, as the Crows come to eat his flesh.

tique: see archæo-. Marked by the characteristics of an earlier period; characterized by archaism; primitive; old-fashioned; antiquated: as, an *archaic* word or phrase.

A person familiar with the dialect of certain portions of Massachusetts will not fail to recognize, in ordinary discourse, many words now noted in English vocabularies as *archaic*, the greater part of which were in common use about the time of the King James translation of the Bible. Shakspeare stands less in need of a glossary to most New Englanders than to many a native of the Old Country.

Lowell, Biglow Papers, Int.

There is in the best *archaic* coin work [of the Greeks]... a strength and a delicacy which are often wanting in the fully developed art of a later age.

Head, Historia Numorum, [Int., lx.

The archaic, in art, not simply the quality of rudeness or of being primitive, but a rudeness and imperfection implying the promise of future advance. Work that is merely barbarous is not properly *archaic*.

The archaic style, in an art of sufficient force to have any development, succeeds the first rude attempts of a people to arrive at graphic representation, and exhibits a manifest sincerity and striving to attain truth, until finally the archaic quality disappears little by little as truth is reached in the great art-schools, such as those of Greece and of the Renaissance painters, or as art sinks into lifeless conventionalism before reaching truth, as in the sculpture of Egypt and Mesopotamia.

The adoption or imitation of that which is antiquated or out of use; especially, the use of archaic words or forms of speech.—2. The quality of being archaic; antiquity of style, manner, or use, as in art or literature; especially, in art, the appearance of traces of the imperfect conception or unskilful handling of tools and material belonging to an art before the time of its highest development. An angel of the highest order; a chief angel. The word occurs in two passages of the Bible, 1 Thes. iv, 16, and Jude 9. Michael, mentioned in the latter as an archangel, also in Daniel as the spiritual prince of the Jews, and in Rev. xii, 7 as the leader of the heavenly hosts against the dragon and his angels, is the St. Michael of the church calendar. Coming after him in dignity, three others are especially known by name as archangels: Gabriel, the heavenly interpreter and annunciator of herald (Dan. viii, 16, ix, 21; Luke i, 19); Raphael, the guardian angel commemorated in the book of Tobit; and Uriel (2 Esd. iv, 1), the fire or light of God, often mentioned like the others, in Milton's "Paradise Lost." Three other names are added by tradition to make the number seven (1 Esd. vii, 1; Rev. viii, 2, where the angels mentioned are taken as archangels), Chamuel, Jophiel or Zophiel, and Zerkuel, and still others are spoken of.

For archangels were the first and most glorious of the whole creation. They were the morning work of God, and had the first impressions of his image.

Druden, Dod., of Plutarch's Lives.

2. A member of the lowest but one of the nine orders of angels composing the "celestial hierarchy" of Dionysius the pseudo-Areopagite, whose classification was adopted by Pope Gregory the Great, and is generally accepted by the theologians of the Roman Catholic Church. See *angelica*.—4. A slim-bodied, thin-faced variety of domestic pigeon, of rather small size, with long head and beak, a peaked crest, and rich metallic lustrous plumage, black on the shoulders and tail, but coppery elsewhere. The origin of the breed is unknown. It was introduced into England from Ghent. The name is supposed to allude to the brilliancy of the plumage. The bird breeds very true, the chief points being the peaked crest and the luster.

archangelus (ärk-an-jel'ik), *a.* [**< ML. archangelus**, **< LG. archāgelus**, **< Gr. ἀρχάγγελος**, *archangel*.] Of or pertaining to archangels; as, "archangelic pomps," Mrs. Browning.

It forms the compression member of the trusswork which transmits the weight of the body of the car from the truck-bolster to the car-axles.

archbishop (ärch'bish'up), *n.* [**< ME. archbishop, archbishop**, **< AS. arce-, arce-**, *arce-*, *arce-* (also *heah-biscop*, lit. high bishop) = *OFries. arcebischoep* = *D. aartsbisschop* = *OHG. erzbischof*, *G. erzbischof* = *Icel. erkbiskup* = *Dan. It was also occasionally applied in the East to exarchs and metropolitans of sees of exceptional antiquity or dignity, and was sometimes extended in later times to others of the same rank as a special distinction. In the West, from the eighth or ninth century, the title was given to metropolitans of every class, and this is still the use of the Roman Catholic Church. Archbishops have certain rights of honor and jurisdiction over their suffragan bishops (that is, the bishops of the dioceses making up their ecclesiastical province), such as those of calling and presiding over provincial councils, receiving appeals in certain cases, etc.; but these rights, formerly very considerable, are now comparatively limited. At present the archbishop is not always a metropolitan, since there have long been a few archbishoprics without suffragans, and oftener still the title is purely honorary. See *primate*. The insignia of an archbishop in the Roman Catholic Church are the wooden pallium, before receiving which from the pope he cannot exercise the functions of his office, and the double cross borne processionally before him. In the Anglican Church there are four archbishops, two in the Church of England (those of Canterbury and York, the former of whom is metropolitan of all England), and two in the Church of Ireland (those of Armagh and Dublin, the former of whom is primate). The Church of Sweden has one archbishop, whose see is at Upsala. Abbreviated to *abp.*

archbishopess (ärch'bish'up-es), *n.* [**< archbishop + -ess**.] The wife of an English archbishop. *Miss Burney*. [Rare.]

archbishopric (ärch'bish'up-rik), *n.* [**< ME. archbishopriche, -ryk**, etc., **< AS. archbiscoprice**, **< archbishop, archbishop**, + *ric*, jurisdiction. Cf. *bishopric*.] The titular see or diocese of an archbishop; the province over which an archbishop exercises authority.

archchancellor (ärch'chän'sel-ör), *n.* [**< arch- + chancellor**, after *F. archchancelier* = *G. erzkanzler*, **< ML. archcancellarius, archchancellor**.] A chief chancellor; formerly—(a) The title of an office in the Roman-German empire, held by the electoral archbishop of Mainz, who was actual chancellor of the empire. (b) An honorary official rank held by the electoral archbishops of Cologne and Treves, the former nominally for Italy and the latter for Burgundy (Gaul and the kingdom of Arles).

archdeacon (ärch'dē'kn), *n.* [**< ME. archdeken, etc.**, **< AS. arcidiacon, ccediacon** = *D. aartsdeken* = *Icel. erkdjākn* = *Dan. erkedegn* = *F. archidiacre* = *Sp. arcediano* = *Pg. arcediano* = *It. archidiacono*, **< LL. archidiaconus**, **< LG. ἀρχidiaconos**, **< Gr. ἀρχή**, *chief*, + *διακονος*, *deacon*.] A chief deacon; strictly, an ecclesiastic who has charge of the temporal and external administration of a diocese, with jurisdiction delegated from the bishop. The word is found as the title of an ecclesiastical dignitary from the fourth century. In the East it is last found as applied to an ecclesiastical officer of the court of Constantinople under the late Byzantine empire. In the West, from the eighth century, dioceses began to be divided into separate territories, over which rural archdeacons were placed, having under them deans or rural archpriests, charged with the supervision of the parish priests of their respective districts; over these was the general or grand archdeacon of the whole diocese, who took precedence of the archpriest (which see), and held his own court with its officials, distinct from that of the bishop, so that appeals were taken from the former to the latter. The rural archdeacons were often priests, having a cure of souls, as was also the grand archdeacon from the twelfth century. The powers and privileges of this office were gradually restricted, and in the Roman Catholic Church, since the Council of Trent, its place is for the most part supplied by the bishop's vicar-general, between whom and the parish priests are sometimes found the vicars forane, or present rural deans; while the archdeacon of the present day, where the office survives, holds a dignity of honor. In the Church of England each bishop has the assistance of two or more archdeacons, whose duties include inspection and management of the affairs of the diocese, and perform a variety of duties partly secular and partly ecclesiastical. In two dioceses of the Protestant Episcopal Church of America the title *archdeacon* has been introduced.—**Archdeacon's court**. See *court*.

It includes man alone, and is contemporaneous with the order *Bimana* of some, or the family *Hominidae* or *Anthropidae* of others. arciere, < ML. *arcarius*, also *arcuarus*, a bowman, < L. *arcus*, a bow: see *arch*¹ and *arch*¹.] 1. One who uses a bow: a Bowman; specifically, in medieval Europe, one who shot with the longbow (which see) and shaft, as distinguished from an arbalester or crossbowman. In cricket the archer is generally represented in Oriental dress and armor, and the use of the bow by a native Greek in war is rarely mentioned; but once the two bowmen of the Iguia temple is dressed and armed as a Greek, and on a Basilican vase at Naples (Heydemann, No. 922), of good Greek work, a painting represents three youths, evidently Greeks, shooting with bows and arrows at a cock on a column. Among the Romans archers are rarely mentioned. Throughout the middle ages the archers formed an important part of the armies of Europe; but, as they were drawn wholly from the peasants and townspeople, the nobility and their retainers were often suspicious of them, and the free use of the bow among the common people was often discouraged. In some countries, too, the arbalest was so much preferred that the longbow came little into use. In England large bodies of archers were furnished by towns and counties to the royal armies, and were armed with some degree of uniformity with the steel cap, the gambeson or hauberk, and a short double-edged sword, besides bow and quiver. There is no record of mounted archers in the English armies, but they were common on the continent; the dukes of Burgundy maintained large bodies of them, and King Charles VII. of France had a body-guard of mounted men armed with brigantine or gambeson, and carrying a longbow. From this last organization the name *archers* came to be applied to the body-guard of one of the later kings of France, whose weapon was the harquebuse, which replaced the bow and shaft, and (until the Revolution) to the watchmen or guards of the French cities.

In Russia the bishops are selected from among the archimandrites. The title has been retained among those who separated from the Eastern Church and submitted to the pope while still observing the Greek rite (the so-called United Greeks), and their monasteries are now subject to one proto-archimandrite. A congregation of Basilian monks existing in Sicily before the eleventh century has been under the care of an archimandrite apparently from that time. Its head abbey is that of San Salvatore in Messina, and it forms an exempt archimandrite immediately dependent on the pope. In the early church, and sometimes during the middle ages in the Western Church, the word was used vaguely as equivalent to *prelate*.

C., or to his mechanical inventions.—**Archimedeal drill.** See *drill*.—**Archimedeal principle, or principle of Archimedes.** (a) The principle of the equilibrium of the lever; namely, that a lever loaded with two weights, on opposite sides of the fulcrum, is in equilibrium when the weights are inversely proportional to the length of the arms at whose ends they hang, and that the pressure on the fulcrum of the lever is then exactly equal to the sum of the two weights. (b) The hydrostatic principle, also discovered by Archimedes, that a body immersed in a fluid loses an amount of weight equal to that of the fluid it displaces.—**Archimedeal propeller, a propeller** consisting of a continuous spiral vane on a hollow core running lengthwise of the vessel. It is an amplification and extension of the screw.—**Archimedeal railway, a form** of railway in which a continuous shaft rotates on pillars between the lines of rails, and propels the car by means of a screw which engages in a pedestal attached to the car.—**Archimedeal screw, a device** for raising water, said to

have been invented by Archimedes. It is made by forming a spiral tube within, or by winding a flexible tube spirally about, a cylinder. When the cylinder is placed in an inclined position, and the lower end is immersed in water, its revolution will cause the water to move upward through the spiral chambers. Whatever quantity of water first enters the screw immediately descends by its own weight to the lowest point of the spiral; but this point being always shifted higher up by the revolution of the screw, the water may thus be raised to a considerable height. Also called *water-screw* and *spiral pump*.—**Archimedeal solid, one** of the thirteen solids described by Archimedes, which, without being regular, have all their solid angles alike, all their faces regular, and not less than four faces of any one kind: sometimes incorrectly called *semi-regular solids*. It was supposed by Gegenbaur to be most nearly approximated in nature by the pectoral member or fin of the ceratodontids, but this view has not been generally accepted; by others the pectoral member of a primitive selachian is believed to approximately realize the idea.

architecture (är'ki-tekt'ür), *n.* [= *F. architecture* = *It. architettura*, **< L. architettura**, **< architectus**, *architect*; see *architect*.] The *Gr.* word is ἀρχιτεκτονία, **< ἀρχιτέκτων**; also ἀρχιτεκτονική; see *architectonic*.] 1. The art of building, specifically of fine or beautiful building. Architecture includes, in the widest sense, (1) the principles of design and of ornament as applied to building; (2) the science of construction, including the properties of materials and the methods of combining them; and (3) the practice of construction, including estimates of cost and the directing of builders and workmen. The practice of this art requires skill in design, which is the special province of the architect, and skill in execution, which is the special province of the workmen whom the architect employs and directs. It is the union of skill in architectural design to combine in a harmonious scheme the independent and often hostile requirements (1) of use

and convenience as dictated by the conditions of the problem in hand; (2) of constructive necessity and fitness as determined either by practical experience or by scientific theory; and (3) of artistic excellence both in the proportions of the parts and in the decorative treatment of details, in accordance with either the general principles and canons of good taste or the prescriptions of custom or tradition. It is the function of skill in execution practically to carry out the scheme so designed, and this skill is exercised by draftsmen, surveyors, mechanics, artisans, and artists, each in his place. Architecture is properly distinguished from mere building by the presence of the decorative or artistic element. The most important styles in the history of architecture are the Egyptian, Assyrian, Hellenic, Roman, Byzantine, Medieval (including Romanesque and Gothic), Renaissance, and Modern. (See these and other adjectives characterizing architectural styles.) The various later medieval styles are commonly included under the vague and misleading term Gothic (which see).

Architecture, the art of building, includes two elements, theory and practice. The former comprehends the fine-art side proper, the body of general rules inspired by taste and based on tradition, and the science, which admits of demonstration, by means of invariable and absolute formulas. Practice is the application of theory to particular needs; it is practice which causes the art and the science to conform to the nature of materials, to climate, to the customs of a period, or to the necessities of the occasion.

Viollet le Duc, *Dict. de l'Architecture* (trans.), I, 116.

We must consider *Architecture* as the great law which has in all time regulated the growth and affected the form of painting and sculpture, till they attain to a certain period in their development, and free themselves from its influence.

One of the giant squids, belonging, doubtless, to the genus *Architeuthis*. archon (är'kon), *n.* [L., < Gr. *ἀρχων*, a ruler, orig. ppr. of *ἀρχω*, rule, be first: see *arch*.]

1. A chief magistrate of some states in ancient Greece, and particularly Athens. After the abolition of the title of king in Attica there was chosen a single archon, who exercised for life essentially royal prerogatives. The term of office was afterward reduced to ten years, and in 483 B. C. it was made annual, and the duties of the archonship were distributed among nine persons. The first was the *archon eponymos* (name giving archon), whose functions were executive and judicial, and whose name was given in official acts, etc., to the year of his service; the second was the *archon basileus* (archon king), whose duties were chiefly religious and ceremonial; the third was the *archon polemarchos* (archon generalissimo), who was, first in fact and then nominally, commander of the military power; and the remaining six were the *thesmothetæ*, or administrators of justice, whose most important duty it was to pass carefully in review, each year, the whole body of laws of the state, in order to make sure that no errors or contradictions had crept in, that repealed laws had been duly canceled, and that repetition was avoided. It rested with the thesmothetæ, also, to see that all the laws of the republic that were in vigor were strictly enforced, and to bring to trial any public official who had failed in his trust. At the end of their year of office, all the archons, unless they were found guilty of malfeasance, by virtue of their office entered the council of the Areopagus.

As a title it dates from the fourth century, and was originally given to the senior by ordination in a diocese, a rule long strictly observed in the West. Though modified several times in its constitution, notably by Solon and Ephialtes, the Areopagus always retained the highest reputation for dignity, justice, and wisdom. Its functions were at once religious, political, and judicial; the scope of its action was thus much wider than that of a supreme court of the present day, extending not only to jurisdiction in cases of homicide and some others in which religion was concerned, and to a general censorship of all affairs of state, but even to the supervision of education, and to cer-

They are still used, especially in France, as the common names of the six notes. Since the intervals between these notes are the same as those between the first six notes of the modern major scale, the syllables have also been used extensively as names for those tones and as guides in studying their relations. Syn. *Argue*, *Dispute*, *Debate*, *Discuss*, plead, expostulate, remonstrate. To *argue* is to defend one's opinion or to exhibit reasons or proofs in favor of some assertion or principle; it implies a process of detailed proof by one of the reasons. To *dispute* may be to call in question the statements or arguments of an opposing party; as, to

dispute about an award. It often means the alternate giving of reasons, especially by two persons. It is often applied to mere backing and is in general less dignified than the other words. To *debate* is to interchange arguments in a somewhat formal manner, as in debating societies and legislative bodies. To *discuss* is, by derivation, to shake or knock a subject to pieces in order to find the truth, or the best thing to be done. A *debate*, therefore, may be viewed as a *discussion*, or a *discussion* as a *debate*. Strictly, a *discussion* is an amicable presentation of opinions, not limited, like the others, to affirmative and negative sides of a proposition, and with the expectation on the part of all that the conclusion will be the adoption of no one person's opinion or plan unmodified. To *argue* a point, to *dispute* a position, to *dispute* with a neighbor, to *debate* a motion, to *discuss* a subject or a plan.

Pope, *Essay on Man*, ii. 75.

The only argument available with an east wind is to put on your overcoat.
Lovell, *Democracy*.

[This, the familiar meaning of the word, probably originated in Roman law courts. The usual definition given by Cicero and almost all authorities is *ratio veridical faciens potest*, a reason causing belief of a doubtful matter. Boetius in one place defines it as a medium proving a conclusion. The word *medium* here means a premise, or premises, according to all the commentators. (*Petrus Hispanus*, tr. v. ad not.) But since *medium* usually means the middle term of a syllogism, some logicians have been led to give *argument* this significance.]

2. The middle term of a syllogism. [See preceding note.]

Argument is the bare proof or mean term which is invented by him that disputeth, to prove the truth of the question; but argumentation is the whole reasoning itself, of what form soever it be, comprehending both the question and also the proof thereof.

Blundeville, 1619.

Argument again, *argumentation*,—what is assumed in order to argue something,—is properly the middle notion in a reasoning—that through which the conclusion is established.

Sir W. Hamilton.

3. A reasoning; the process by which the connection between that which is or is supposed to be admitted and that which is doubted or supposed to need confirmation is traced or tested.

Tables of double entry have two arguments. In the Ptolemaic astronomy, the argument, without qualification, is the angular distance on the epicycle of a planet from the true apogee of the epicycle; and the equation of the argument is the angular distance, as seen from the earth, of a planet from the center of the epicycle, the correction to the second inequality. pl. In *bot.*, anything that serves as a defense to a plant, as prickles, thorns, or spines.—6. *pl.* In *zoo.*, the legs of a hawk from the thigh to the foot.—7. *pl.* The heraldic bearings of an individual or a community, consisting of some device in heraldic tinctures (see *tincture*) borne on a shield, generally with the addition of a crest and sometimes with supporters. A description in heraldic terms of shield, crest, etc., is called *blazoning* (which see). The right to bear the arms of the father is inherited by the sons, but in strictness each of the younger sons should add to the paternal shield a label as a mark of cadency; the same right descends to a daughter only if she is her father's heiress. A person inheriting an estate other than the paternal one often assumes the arms of the former possessor, but should in strictness apply to the proper authorities. See *king-at-arms*, *herald*, and *herald's college*. Arms not paternal may be classed as follows: (a) *Arms of dominion*, or the national arms borne by the sovereign, in which generally the bearings inherited by the prince as an individual have come to have a certain national character. (b) *Arms of community*, as of a corporation, an episcopal see, or the like. Arms assumed by a republic, as by the United States or by one of the States, partake of the nature of both the preceding. (c) *Arms of pretension*, as, specifically, those assumed by a sovereign in assertion of his claim to a realm not actually under his authority, like the *flours-de-lis* of France, which were borne by English sovereigns until 1801. (d) *Arms of succession*, denoting inheritance of an estate, as mentioned above. (e) *Arms of assumption*, or *assumptive arms*, bearings assumed or granted in consequence of an exploit, as the three feathers with the motto *Ich Dien* taken from the slain King John of Bohemia by Edward the Black Prince at the battle of Crécy (1346), and now borne by the Prince of Wales. (f) *Arms of alliance*, as where one spouse impales the arms of the other on his or her shield. (g) *Arms of office*, arms which are the perquisite or appendage of some public position. In all the above cases except (a) and (b), a private individual having a right to such arms charges them with the paternal arms, whether by quartering or otherwise. For the origin and history of arms, see *heraldry*. Abated arms. See *abate*.

Adoptive arms. See *adoptive*.—Allusive arms, in *her.*, a bearing or bearings having immediate reference to the wearer's name; thus, the arms of a person named Lamb or Herring would be termed *allusive*, if they included as a bearing a figure of the animal so named. In this way the name De Loupe may have been given to the first earls of Chester because of their bearing a wolf's head, or the name Arundel may be derived from swallows (French *hirondelles*) borne on the shield. The arms of Bolton are a crossbow-bolt driven through a tun. Castle and Leon had for their chief bearings a castle and a lion respectively. There are many such cases. Also called *allusive heraldry*, *canting heraldry*, *rebus*, and *armes parlantes*.—Arms-carrying Act. See *Bill of Rights*, under *bill*.—Arms of precision, firearms rifled, furnished with graded sights, accurately prepared bullets, and appliances calculated to enable them to act with precision and rapidity, and at much greater distances than ordinary weapons. The Armstrong gun and the Springfield and Martin-Henry rifles are examples. Assize of arms. See *assize*. Assumptive arms. See above, 7 (c), and *assumptive*.—Coat of arms. See *coat*.—Places of arms, in *fort.*, parts of the covered way opposite the salient and reentering angles of the counterscarp.—Repeating arms, arms that can be discharged a number of times without being reloaded.—Rifled small arms, rifles, muskets, carbines, pistols, or revolvers, the bores of which are cut with spiral grooves or "rifles."—Small arms, all weapons not requiring carriages, as opposed to *artillery*, and including rifles, muskets, bayonets, pistols, revolvers, sabers, and swords; also, sporting weapons.—Stand of arms, a complete set of arms for one soldier, consisting of a musket, bayonet, cartridge-box, and belt, with or without a sword.—To arms! a warning equivalent to "arm! take to your arms; make ready for battle." (Compare *alarm*.)—To bear arms, to do military service; serve as a soldier.

Nathaniel Ward, *Simple Coder*.

armada (är-mä'dä), *n.* [Early mod. E. also erroneously *armado* (also sometimes as *It.*, *armata*): < Sp. *armada* = Pr. Pg. *armada* = It. *armata* = F. *armée* (> E. *army*², *q. v.*), lit. an armed force, army, navy, < ML. *armata*, an armed force, an army, prop. fem. of L. *armatus*, pp. of *armare*, arm: see *arm*², *v.*, and also *army*, which is a doublet.] 1. A fleet of war-ships; a squadron. The Spanish or Invincible *Armada*, which consisted of 130 large ships, was sent by Philip II. against England in 1588, during the reign of Elizabeth, but was repulsed, and afterward almost entirely destroyed by storms off the Orkney islands and in the western coast of Ireland.

armadillo (är-mä-dil'ō), *n.* [Formerly also *armadillo*, *armadillo*, *armadile*: < Sp. *armadillo* (= Pg. *armadillo*), dim. of *armado*, armed, with reference to its bony shell. Cf. ML. *armadillus*, a kind of sea-fish.] 1. An American edentate quadruped, of the order *Bruta* (or *Edentata*) and suborder *Loricata*, and of the extant families *Tatusidae*, *Dasypodidae*, and *Chlamyphoridae*, or of the extinct family *Glyptodontidae*, having a hard shell or carapace like a coat of mail, resulting from a peculiar ossification of the integument and the confluence of numerous small scutes. In the glyptodonts the carapace was entire and fixed, and even in some cases covered the belly as well as the back; but in all the living armadillos the shell is divided into an anterior, a posterior, and an entire or variously divided middle part. When the division of the middle part is complete, the animal can roll itself into a ball. The teeth are numerous, but vary in number and other characteristics with the several genera; in the genus *Protonotus* they are a hundred in number. The pig is an armadillo of the family *Tatusidae*, the *Tatusia* *inermis*, the only one of the group found as far north as the United States. There are other species. The embelem is the typical armadillo of the family *Dasypodidae*. The pig is *Dasypus* *villosus*. The kabassons constitute the genus *Armadillo*. The kabasson is *Protonotus*. The apatis are the three-banded armadillos, of the genus *Phyllocolpa*. The pichicagos constitute the family *Chlamyphoridae*; they are the smallest and most puerile forms, being less than a foot long, while the kabasson is three feet long without the tail. All these animals are mild, timid, and inoffensive, subsisting on roots, leaves, and fruits, sometimes on insects or flesh. They are able to dig into the ground with great rapidity, and escape from their enemies in this way as well as by rolling up in a ball. The flesh is considered good for food.

Armadillo, or Pichico. *Dasypus villosus*.

2. In *Crustacea*: (a) [*cap.*] A genus of isopods, of the family *Oniscidae*, including the pill-bugs, which can roll themselves into a ball like the mammals called armadillos. (b) A species of this genus; a pill-bug or sow-bug; a kind of wood-louse.—3. A name given to an electric battery composed of copper and zinc elements riveted together, and designed to be worn as a remedy in certain diseases.

Glover.

It was necessary for him . . . to proceed with his twenty men-of-war to the Mediterranean, while his superiors, with the rest of the *armament*, returned to the Channel.

Macaulay, Hist. Eng., xx.

2. Munitions of war; especially, the number and weight of all the guns which a ship of war carries. Within a comparatively short period remarkable changes have occurred in the size and weight of the armament of war-vessels. In the United States, before the civil war, the usual armament for both forts and vessels consisted of 32 pounders. The war led to the construction and use of 15-inch smooth-bore guns, weighing 50,000 pounds, and afterward of 20-inch guns, weighing 100,000 pounds. Rifled cannon, which had been introduced in 1859, were also increased in size up to the 10-inch-bore Parrott gun throwing a 300-pound projectile. Of other countries, the armament of the British navy may be taken as representative. In 1861 the "Warrior" was provided with 43-ton guns; but since then the weight of metal has been successively increased up to the 80-ton guns of the "Inflexible" and the 110-ton guns of the barbet ship "Camperdown." In Europe preference is given to the piercing power of elongated projectiles moving at a great velocity and fired from rifled guns. In the United States reliance has until recently been placed upon the smashing effect of heavy spherical projectiles fired at a low velocity from smooth-bore guns. See *gun*.

with holding Monophysite or Eutychian doctrine, but many authorities hold that the differences arose from misunderstandings occasioned by the incapacity of the Armenian language to express the finer distinctions of Greek terminology. The Armenian Church accepts all the first seven ecumenical councils, with the exception of that of Chalcedon, the doctrines of which they seem, however, to hold under a different phraseology. Their doctrines and usages closely resemble those of the Greek Church, with the exception of their use of unleavened bread and of an unmixed chalice in the eucharist. The priesthood is hereditary. The bishops are governed by four patriarchs the primate being the catholicos, who resides in the monastery of Etchmiadzin, a short distance north of Mount Ararat. Since the fifteenth century a large number of the Armenians have joined the Roman Catholic Church and are known as *United Armenians*. A separate Armenian Protestant Church has also recently been formed.—**Armenian era, liturgy, etc.** See the nouns.—**Armenian stone**, a soft blue carbonate of copper; also, a commercial name for lapis-lazuli.

Its members were also called *Remonstrants* from a statement of their views in the form of a remonstrance presented to the States General in 1610. They separated from the Calvinists, objecting to their doctrine of predestination. The sect as a distinct organization is chiefly confined to the Netherlands, where it numbers only about twenty congregations and a few thousand adherents.

armor-plate (är'mor-plät), *n.* A metallic plate, usually of iron or steel, intended to be attached to the side of a ship or the outer wall of a fort, with the view of rendering it shot-proof. A protection of iron for ships was proposed in the early part of the present century, but the first practical application of it was probably to the French floating batteries used in the Crimean war. The success of these led the French to construct "La Gloire," the first of the so-called ironclads, completed in 1861. This vessel, which had 4-inch wrought-iron plates over a backing of about 3 feet in thickness, was speedily followed in 1861 by the "Warrior" and other ships of the same class built by the British government, with 4½-inch plates over 18 inches of teak backing. The thickness of the armor has been increased as more powerful ordnance has been contrived, the plates of the "Bellerophon" of the British navy ranging from 16 to 24 inches. The armor-plate of the United States monitors varies from 5 to 10 inches, and the backing from 28 to 48 inches. See *ironclad*.—**Armor-plate cradle**, a device used for bending armor-plate. It is placed near the furnace, and the plate is laid within it while hot. The bed is formed by numerous cross-bars of iron, so placed that their upper edges correspond to the curve desired in the finished plate. Bars are similarly placed above the plate, and the bending is effected by driving wedges between the upper bars and the upper surface of the plate, which is thus forced down upon the bed-bars.—**Compound steel-faced armor-plate**, armor-plate made of iron faced with steel. It is made up to 24 inches in thickness, and the largest plates weigh about 50 tons. The steel face is ordinarily about one third of the thickness of the whole plate. The two metals are welded together by heavy rolls, through which they are passed while hot, and thus make a solid plate.
